Foreword

This study presents a range of indicators to enable comparisons between the pension systems of economies in the Asia/Pacific region. It also includes data for the larger countries that are members of the Organisation for Economic Co-operation and Development (OECD). The report was drafted by Andrew Reilly of the Social Policy Division of the OECD Secretariat. Lucy Hulett prepared the manuscript for publication. For this sixth report we are again indebted to the national experts who contributed to the updating of the models used, many of whom also assisted with previous publications. We are also indebted to the Korea Policy Centre staff for all their assistance in organising the annual meetings and for co-ordinating contacts with national experts.

Executive summary

The biggest challenges facing pension systems in non-OECD Asian economies are rapid population ageing, low levels of safety-net benefits and low coverage for earnings-related schemes. How to close the coverage gap and how to increase safety-net benefits to provide better protection are at the heart of discussions in many economies. Increasing life expectancy may weaken financial sustainability as people live longer in retirement and the number of pensioners relative to contributors grows. Moreover, as in other regions, reforming pensions is politically challenging as it often entails unpopular measures, such as increasing the retirement age, lowering benefits or increasing contribution rates.

The international exchange of pension reform approaches and experiences can provide valuable lessons for the design and implementation of future reforms. However, it is not always easy to compare the functioning of national pension systems due to significant differences in institutional, technical and legal details.

This study combines rigorous analyses with clear, easy-to-understand presentation of empirical results. It does not advocate any particular type of pension system or reform. The goal is to inform the debates on retirement-income systems with data that policy makers, experts and stakeholders with different visions for the future of pensions can all use as a reference point.

The format of this sixth report follows that of the previous editions that were based on the OECD's *Pensions at a Glance* series now covering the 38 member countries. The values contained within reflect the pension parameters in 2022. As with the original publications the report refers to single pensioners rather than family units.

The results are provided for three distinct earnings levels to enable a more comprehensive portrayal of national pension systems. Firstly, results are given for workers at average earnings, where it is assumed that the worker earns this relative level throughout their entire career without any period of interruption. The remaining two earnings levels are 50% of average earnings, commonly called low earners, and 200% of average earnings, referred to as high earners. Entry to the pension system is assumed to be at age 22 and the models are based on a full career until the normal retirement age applicable in the respective pension system; for China, for example, it is assumed that a man will have to work for 38 years until age 60 before being eligible for retirement pension.

The report begins by showing the different schemes that make up each national retirement-income provision, including a summary of the rules that apply. This is followed by a brief summary of several indicators that are the benchmarks of any pension system analysis, namely replacement rates and pension wealth. These indicators are examined on both a gross and net basis. The subsequent sections look further at both the characteristics of Asian pension systems as well as the population as a whole, through coverage, life expectancy and general demographics. Finally, Chapter 4 of the report provides detailed background information for all of the non-OECD economies covered. Comparable information on OECD countries is available online in the *Pensions at a Glance* series.

To enable comparison between the non-OECD economies and specific OECD countries, the results are grouped by region and OECD status. The largest such grouping is East Asia/Pacific, which covers China,

Hong Kong (China), Indonesia, Malaysia, the Philippines, Singapore, Thailand and Viet Nam. Within South Asia the remaining non-OECD economies are listed, i.e. India, Pakistan and Sri Lanka. Furthermore, the OECD countries themselves have been divided into two distinct groups: the Asia/Pacific countries of Australia, Canada, Japan, Korea, New Zealand and the United States; the largest European economies of France, Germany, Italy and the United Kingdom.

1 Design of pension systems

The indicators in this chapter detail the design of the national retirement income systems in the economies studied. The first indicator shows the taxonomy of the different kinds of retirement-income programmes found around the world. It uses this framework to describe the architecture of the 11 economies' pension systems. The second indicator covers basic, targeted and minimum income systems, showing the value of these systems. The third indicator looks at the mandatory earnings-related pension systems showing how benefits are determined in these schemes and the range of earnings that are covered. The final two indicators present the current and future retirement ages by pension scheme for individuals. Current ages are for those who retired in 2022 after a full career from age 22, while future retirement ages are for those entering the labour market at age 22 in 2022.

Architecture of national pension systems

Key results

Retirement-income regimes are diverse and often involve a number of different programmes. The taxonomy of pensions used here consists of two mandatory “tiers”; the first generates retirement income independent of past earnings level with the second covering earnings-related components. Voluntary provision, be it personal or employer-provided, makes up a third tier.

Figure 1.1 is based on the role of each part of the system. The first tier comprises programmes offering the first layer of social protection in old age, and for which past earnings are irrelevant in the calculation of retirement income. Such schemes often target some absolute, minimum standard of living in retirement. Mandatory earnings-related components (second tier) contribute to smoothing consumption, and therefore standards of living, between working life and retirement. *Pensions at a Glance* focuses mainly on these mandatory components, although information is also provided on some widespread voluntary, private schemes (third tier).

Table 1.1 shows the architecture of pension systems in Asian economies based on the rules that determine eligibility and benefit level while categorising mandatory earnings-related pensions as public or private in accordance with national accounts. Panel A describes the latest legislation applying to future retirees while Panel B shows where those rules have changed compared to current retirees.

Basic pensions can take two different forms: a residence-based benefit or a benefit that is only available to those who contributed during their career. The level of the benefit may vary with the number of residence or contribution years but is independent of the earnings level during the career. Out of the Asian economies only Thailand has a residence-based basic pension for future retirees, with payment rates that vary by age. Two of the listed OECD countries have such a scheme, namely Canada and New Zealand. The Philippines, along with Japan, Korea and the United Kingdom have contribution-based basic pensions.

Eligibility for **targeted** plans requires meeting some residence criteria. In these plans, the value of the benefit depends on income from other sources and possibly also assets. Hence, poorer pensioners receive higher benefits than better-off retirees. Most economies have general safety nets of this type but only those are marked in which full-career workers with very low earnings (30% of average) would be entitled. This only holds for Hong Kong (China) for the Asian economies and Australia and Canada for the selected OECD countries.

Minimum pensions can refer to either the minimum of a specific contributory scheme, or to all schemes combined and are currently found in six Asian economies. In most countries, the value of entitlements only takes account of pensions rather than testing for other income. Minimum pensions either define a minimum for total lifetime entitlements, which may increase in level once the length of the contribution period exceeds certain thresholds, or they are based on minimum pension credits that calculate year-by-year entitlements of low earners based on a higher earnings level.

For the Asian economies, they all have mandatory second-tier earnings-related pensions, with New Zealand being the only country shown that does not have such a system amongst the OECD countries. There are four kinds of scheme.

For future retirees’ public pay-as-you-go schemes will follow a general **defined benefit** (DB) format in six Asian economies and five of the listed OECD countries, with pension’s dependent on the number of years of contributions, accrual rates and individual pensionable earnings.

There are no **points** schemes in any of the Asian economies covered here and amongst the OECD countries shown only France and Germany have such a system. Workers earn pension points each year based on their earnings. At retirement, the sum of these pension points is multiplied by a pension-point value to convert them into a regular pension payment.

There are **notional defined contribution** (NDC) schemes at the core of the pension system in one of the Asian economies, China, and one of the listed OECD countries, Italy. These are pay-as-you-go public schemes with individual accounts that apply a notional rate of return to contributions made, mimicking Funded defined contribution (FDC) plans. The accounts are “notional” in that the balances exist only on the books of the managing institution. At retirement, the accumulated notional capital is converted into a monthly pension using a formula based on life expectancy.

Funded defined contribution (FDC) plans are compulsory for future retirees in eight Asian economies and two OECD countries. In these schemes, contributions flow into an individual account. The accumulation of contributions and investment returns is usually converted into a monthly pension at retirement.

Figure 1.1. Taxonomy: Different types of retirement-income provision

Table 1.1. Structure of future mandatory retirement-income provision

	First tier		Second tier					First tier		Second tier				
	Residence-based		Contribution-based						Residence-based		Contribution-based			
	Basic	Targeted	Basic	Minimum	Public	Private			Basic	Targeted	Basic	Minimum	Public	Private

Basic, targeted and minimum pensions

Key results

Residence-based basic pensions exist in nine OECD countries and are, on average, worth 21% of the gross average wage. All OECD countries provide targeted benefits for their residents to ensure at least some income. On average in the OECD, people without a contributory record could receive 16% of gross average earnings from targeted schemes, subject to a means test, and 21% when including residence-based basic pensions. For the nine OECD countries with contribution-based basic pensions the full benefit equals 15% of the gross average wage on average. Half of OECD countries provide a minimum pension benefit within their contributory scheme, with the full minimum contributory benefit level averaging 25% of average earnings for these countries.

There are four main ways in which OECD countries might provide retirement incomes to meet a minimum standard of living in old age (

Table 1.2). The left-hand columns of the table for each economy show the value of benefits provided under these different types of schemes. Values are presented in relative terms – as a percentage of economy-wide gross average wages – to facilitate comparisons between economies (see the “Average wage” indicator in Chapter 3). The right-hand columns show the number of total recipients as a share of the population aged 65 and over.

Benefit level

Benefit values are shown for a single person. In some cases – in particular for minimum contributory pensions – each partner in a couple can receive an individual entitlement. In other cases – especially for targeted schemes – the household is treated as the unit of assessment and generally receives less than twice the entitlement of a single person.

The analysis of benefit values can be complicated by the existence of multiple programmes in some economies. In some cases, benefits under these schemes are additive while in others, there is a degree of substitution between them.

There are five economies that do not have either a basic or minimum pension within their system (China, Hong Kong (China), Malaysia, Singapore and Sri Lanka). Only Thailand has a basic pension. India, Indonesia, Pakistan, the Philippines and Viet Nam all have minimum pensions.

Figure 1.2 summarises the level of non-contributory residence-based benefits. A residence-based basic pension is only present in Thailand. On average amongst all Asian economies, 9% of gross average earnings can be received from basic or targeted schemes subject to means tests.

As for the contributory components of first-tier pensions, six Asian economies have neither contribution-based basic nor minimum contributory pensions (Figure 1.3). Only the Philippines has a contribution-based basic pension. In five Asian economies, low contributory pensions are topped up to a higher minimum pension level, up to 19% of average earnings, on average, among countries with minimum contributory pensions. These minimum pensions vary between a low of about 5% of the average wage in India to a high of about 42% in Pakistan.

Coverage

The importance of first-tier benefits varies across Asian economies. The percentage of over-65s receiving such benefits is shown in the final four columns of

Table 1.2. Different approaches of reporting the number of recipients, for example in case of benefits paid to couples or even households, may blur the data comparability across economies to some extent.

Naturally, residence-based basic pensions have on average the highest coverage. However, contribution-based basic pensions also have very high recipient numbers in most economies that have such a scheme. Sometimes recipient numbers exceed 100% of the population aged 65 and older hinting to recipients younger than 65 or living abroad.

Targeted schemes in Asian economies show the greatest variation, being claimed by only 2% of those aged 65 or over in Indonesia and 7% in Malaysia but by 56% of those in the Philippines and 42% in Hong Kong (China). These higher rates are primarily due to historically low coverage rates in mandatory pension schemes.

Table 1.2. Current level and recipients of first-tier benefits

	Benefit value in 2022 (% of gross AW earnings)				Recipients in 2022 (% of population aged 65 and over)					Benefit value in 2022 (% of gross AW earnings)				Recipients in 2022 (% of population aged 65 and over)

Mandatory earnings-related pensions

Key results

The second tier of the OECD's taxonomy of retirement-income provision comprises mandatory or quasi-mandatory earnings-related pensions, covering defined benefit, points and defined contribution schemes. Key parameters and rules of these schemes determine the value of entitlements.

Generic earnings-related schemes are of three different types governed by different rules of benefit calculation. Defined benefit (DB) schemes typically specify an accrual rate, expressed as a percentage of individual pensionable earnings, at which benefit entitlements build up for each year of coverage. The higher the contribution rate the higher the accrual rate that can be sustained. Defined benefit schemes can be funded or pay-as-you-go or a combination of both over their lifetime. In points schemes, the pension benefit is equal to the number of points accumulated during the career multiplied by the point value. Defined contribution (DC) schemes are individual account-based schemes that accumulate contributions during the working career to finance retirement. When the accounts accumulate capital in the form of financial assets, these schemes are classified as funded defined contribution (FDC) while if schemes are based on notional accumulated capital, then they are referred to as notional defined contribution (NDC) schemes. In both cases for the modelling of a replacement rate in Chapter 2 an annuity divisor is applied to transform financial assets (real or notional) into monthly pensions. Table 1.3 presents future parameters and rules for benefit calculation that will apply to people who enter the labour market in 2022, according to the latest legislation.

Within PAYG DB schemes, accrual rates of at least 2% apply in Pakistan, the Philippines and Viet Nam. China and Indonesia credit the lowest rates of 1.0%. In Thailand the accrual rate varies by career length. In Viet Nam it varies by gender. In some economies, total accrual rates are limited by an earnings ceiling or by a maximum number of years that generate accruals.

Pensionable earnings measures used to calculate benefits differ across economies. Only China, Indonesia and Viet Nam use the entire career earnings with Pakistan using the final year of earnings and India, the Philippines and Thailand using the final five years.

All schemes apply a valorisation rate to past earnings to take account of changes in “living standards” between the time pension rights accrued and the time they are claimed. The most used rate among Asian economies is price inflation with China being the exception using wage growth. Also, the Philippines has no valorisation rule.

For DC plans the cumulative growth of the contributions is determined by the rates of return. It is based on financial market returns in FDC schemes and on notional interest rates in NDC schemes. One key parameter for DC plans is the contribution rate paid into individual accounts.

All Asian economies except Malaysia and Sri Lanka set a limit on the earnings used to calculate pension benefits. The highest ceiling applies in the DB scheme in Viet Nam at over 8 times average earnings. The lowest at 0.54 and 0.92 times are in Pakistan and Thailand respectively.

Indexation refers to the growth of pensions in payment, i.e. during retirement. Price indexation is most common. China is the exception with no set indexation rule and so it is classified as discretionary.

The effective accrual rate measures the rate at which benefit entitlements are effectively built for each year of coverage. It thus depends on modelling assumptions and is closely connected to the replacement rates

shown in Chapter 2. For DB schemes, it equals the nominal accrual rate after adjusting for all the elements that apply to pensionable earnings i.e. thresholds, valorisation of past earnings, sustainability factors. In FDC and NDC schemes the effective accrual rate is the replacement rate, which depends on contribution rates, rates of return and annuity factors, divided by the number of years of contribution.

Based on current legislation, at the average-wage level, the highest future effective annual accrual rate of 1.9% is in the Philippines. The lowest rates, below 0.5%, are in the FDC schemes in Hong Kong (China) and India.

Table 1.3. Future parameters and rules of mandatory earnings-related pensions, latest legislation

At the normal retirement age of a full-career worker who entered the labour market at age 22 in 2022

	Type of scheme	DB schemes	DB, points or NDC schemes			FDC or NDC schemes	Ceiling for pensionable earnings (multiple of average earnings)	Effective accrual rate of a male full-career average earner (% of earnings)
		Nominal accrual rate (% of individual pensionable earnings)	Earnings measure	Valorisation rate	Indexation rate	Total contribution rate (%)		
East Asia/Pacific								
China	NDC + FDC	1.00	L	w	d	20.0/8.0	3.00	1.00/0.80

Malaysia	FDC					23.0-24.0		1.15
Philippines	DB + FDC	2.00	max (f5,L)				1.82	1.91
Singapore	FDC					37.0	1.30	1.34
Thailand	DB	1.33/1.5	f5	p	p		0.92	1.26
Viet Nam	DB	2.0/3.0	L	p	p		8.03	1.47
South Asia								
India	DB + FDC	1.43	f5		p	15.67	0.80/None	0.65/0.43
Pakistan	DB	2.00	f1	p	p		0.54	1.08
Sri Lanka	FDC					20.0		0.97
OECD Asia/Pacific								
Australia	FDC					12.0	2.54	0.58
Canada	DB	0.83	L	w	p [c]		0.79	0.72
Japan	DB	0.55	L	w	p or w [a]		2.39	0.50
Korea	DB	0.44	L	w	p		1.33	0.44
New Zealand	None							
United States	DB	1.23 [w]	B35	w or p	p		2.27	0.87
Other OECD								
France	DB / points	1.16	B25 / L	p / w	p / p		0.99 / 7.92	0.98 / 0.36
Germany	Points		L	w	w – x		1.54	0.97
Italy	NDC		L	g	p	33.0	3.10	1.55
United Kingdom	FDC					8.0	1.13	0.45

Note: Empty cells indicate that the parameter is not relevant. [a] = varies with age, [c] = valorisation/indexation conditional on financial sustainability, [w] = varies with earnings, B = number of best years, f = number of final years, L = lifetime average, d = discretionary valorisation/ indexation, g = growth of gross domestic product; p = price inflation, w = growth of average earnings. Germany: x depends on changes in both sustainability and contribution factors. Italy: indexation is to price inflation for low pensions and 75% of price inflation for high pensions. Japan: indexation is to earnings growth until age 67 and to price inflation after age 68. United States: valorisation with earnings growth to age 60, no adjustment from 60 to 62, valorisation with price inflation from 62 to 67. Accrual rates applied to average earnings measure at retirement rather than annual earnings in the years of contribution. In some countries accrual stops after a certain number of contribution years or when a certain total accrual rate is reached. This is the case in Canada (40 years) and the United States (35 years). In other countries a maximum pension or a late retirement age may stop accrual too.

Current retirement ages

Key results

The rules for eligibility to retire and withdraw a pension benefit are complex and often reflect conflicting objectives. This is all mirrored in the different criteria for pension benefit withdrawal in different schemes. The 2022 average normal retirement age across Asian economies for an individual with a full career and who entered the labour market at age 22 was equal to 59.1 years for men and 57.3 years for women. For the OECD countries the average was 64.4 years for men and 63.6 years for women.

In many Asian economies, rules differ across pension components. The normal retirement age (NRA) is the eligibility age to pensions without penalty in all schemes combined after a full career from age 22. Where retirement ages differ across schemes the maximum age across schemes thus defines the NRA. The exception to this rule is for targeted schemes that do not even apply to full career workers at low earnings levels.

Table 1.4 shows the rules for both normal and early retirement for mandatory pension schemes. In some schemes, a pension can be claimed earlier than the normal retirement age, from the “early” retirement age onwards, implying benefit penalties.

Early age

The early retirement age is the first age at which a pension can be claimed (Table 1.4). It is generally not possible to retire before the standard statutory age within residence-based basic pensions or for safety-net benefits.

In the Asian economies, it is only possible to retire early in a few countries. Early retirement is at age 50 and age 60 for the FDC schemes in Malaysia and Hong Kong (China), respectively. In Viet Nam early retirement is possible five years before the normal retirement age, which means 55.5 for men and 50.7 for women in 2022, though the retirement ages are currently undergoing increases over the next decade or so.

Normal retirement age

The OECD defines the normal retirement age in a given country as the age of eligibility of all schemes combined without penalty, based on a full career after labour market entry at age 22. However, at retirement not all of the different components actually apply. For example, men and women in Malaysia, are eligible for the defined contribution component at age 55 but they are not eligible to the targeted pension before age 60. As they would be ineligible for the targeted scheme at age 60 with a full career their normal retirement age is therefore 55 years in 2022 (Figure 1.4).

In 2022, the average normal retirement age was equal to 59.1 years for men and 57.3 years for women across the Asian economies. For the OECD countries it was much higher at 64.4 years for men and 63.6 years for women. It ranges from a low of 50 for women in Sri Lanka and blue-collar female employees in China, and 55 for men in Malaysia, Thailand and Sri Lanka to 65 in Hong Kong (China) and Singapore for both men and women.

Pension schemes in four Asian economies still specify normal retirement ages by gender setting a lower age for women than for men. The largest gender gap of 5 years are in China, Pakistan, Sri Lanka and Viet Nam (Figure 1.4).

Future retirement ages

Key results

Future normal and early retirement ages will rise on a limited basis in the Asian economies. Assuming labour market entry at age 22 in 2022 the normal retirement age will increase to 60.0 for men and 58.5 for women on average against 59.1 and 57.3 years, respectively, for retirement in 2022. For the OECD the normal retirement age will increase from 64.4 to 66.3 for men and from 63.6 to 65.8 for women.

Normal retirement age

Across OECD countries, the average normal retirement age for a man with a full career from age 22 equalled 64.4 years in 2022 (Figure 1.5). For those entering the labour market in 2022, this age will increase to 66.3 years (hence around 2066). For the Asian economies there is less movement in retirement ages, with an increase from 59.1 to 60.0 years for men and from 57.3 to 58.5 years for women, as only two countries, Indonesia and Viet Nam, currently have legislation in place to increase retirement ages.

Indonesia has a current retirement age of 57 years, but it will be 65 years for those entering the labour market at age 22 in 2022. Viet Nam will move to 62 years for men and 60 years for women, compared to 60.5 years and 55.7 years, respectively, for current retirees.

For the OECD the normal retirement age will increase in seven out of the ten countries listed, with Canada, Japan and New Zealand being the exceptions. The largest increase is projected for Italy, from 64 currently (the retirement age in 2022 was temporarily lowered for full career workers from 67 years) to 71 years.

The lowest future retirement age for men will equal 55 in Malaysia, Sri Lanka and Thailand, with women being able to retire at age 50 in Sri Lanka and age 55 in China, Malaysia, Pakistan and Thailand.

In 2022, gender differences in the normal retirement age existed in four Asian economies (Table 1.5). These gender gaps are all at least five years and will remain so for those entering the labour market in 2022, except for Viet Nam, where the gap will be reduced to two years.

Early retirement

Under the assumption of full annuitisation, FDC schemes benefits are automatically actuarially adjusted to the age at retirement and, therefore, only an early retirement age is specified, like in Australia. However, in the Asian economies the FDC schemes in China, Hong Kong (China), India, Indonesia, Malaysia, Singapore and Sri Lanka still specify a standard retirement age indicated as normal age in the table.

The DB schemes in India, Pakistan and Viet Nam allow to claim a pension early. Only Pakistan has a penalty with the other countries just calculating the pension as normal, with fewer years of contribution.

Countries that combine basic or targeted schemes with occupational pensions typically set a comparatively low retirement age in the occupational scheme while the basic or targeted scheme assures a certain minimum retirement income only above 65.

Late retirement

Options for retirement deferral often mirror those for early pensions. DB, FDC and points schemes usually compensate the shorter expected retirement spell by bonuses which tend to be higher than the penalties for early retirement. Amongst the Asian economies only India has a bonus for deferral, equating to 4.0% for one year and 8.16% for two years, with no further bonus. Pension deferral is not possible in many countries as the pension has to be claimed at the normal retirement age (see country chapters for further details).

Table 1.5. Future ages, penalties and bonuses for early, normal and late retirement by type of pension scheme

For an individual with an uninterrupted career after entering the labour market at age 22 in 2022

		Scheme	Early age	Penalty (p.a.)	Normal age	Bonus (p.a.)		Scheme	Early age	Penalty (p.a.)	Normal age	Bonus (p.a.)

Coverage

Key results

The level of coverage, the proportion covered by mandatory pension schemes, in non-OECD economies ranges from 90.8% in Hong Kong (China) to only 6.6% in Pakistan, for the population aged 15 to 64. In contrast the OECD average is 75.8% and is as high as 95.6% in Australia. For the labour force the non-OECD economies range from 120.6% to 12.4%, while the OECD average increases to 95.1%, with Australia again highest at 117.2%.

Coverage is defined as the proportion of people that are covered by mandatory pension schemes. The measures used here are: i) the population aged 15 to 64; and ii) the active labour force. The coverage percentage is a measure of how effectively a pension system is being utilised by the pre-retirement population and can act as an indicator of future trends. The coverage value is expressed as the percentage of the population or labour force that is classified as active members of a mandatory pension system during the indicated year. Active members include those that have either contributed or accrued pension rights in any of the major mandatory pension schemes during the indicated year.

For OECD countries there is very little variation between countries using either the population or labour force measurement. The average coverage percentage within the OECD countries listed is 76% for the population measure and 95% using the labour force methodology (Table 1.6). The lowest levels are found in Germany, Italy and Korea at under 70% of the population aged 15 to 64. However, when looking at the labour force percentage Italy increases to 96%, well above Germany (84%) and Korea (78%). All of these levels are still well beyond all of the Asian economies, with the exception of Hong Kong (China) and Singapore for the population percentage and also the Philippines is added when considering the labour force.

The remaining Asian, non-OECD, economies vary considerably in the levels of coverage using either measurement. Pakistan is the lowest on either measure with coverage less than half of that of any other economy. Only the Philippines and Singapore along with Hong Kong (China) have coverage above 50% for the population measure and over 80% for the labour force. India, Malaysia and Viet Nam are around 25-33% for the population measure with Indonesia and Sri Lanka both under 20%. When considering the size of the populations in this region of the world it becomes apparent that the lack of coverage is a global rather than regional issue.

In several economies the percentage of coverage for the labour force is well above 100%. This results from it being possible for individuals to have multiple accounts and also for those currently outside the labour force to have previously being a paid member of an account. In general, for these reasons the numbers for the labour force are particularly inflated, but the multiple account scenario also inflates the population statistic. Conversely, as the retirement age is below 65 in many of the economies listed the population base of 15-64 is not the most appropriate for all the economies and will underestimate the relevant coverage figure. For example, the retirement age in Thailand is 55 years, so if the population base of 15 to 54 was used instead of 15 to 64 then the coverage figure would increase from 47.6% to 59.6%.

Coverage statistics are better analysed in conjunction with life expectancy and population projections, in order to estimate the numbers of people actually involved rather than percentage (see Chapter 3). Analysis of these characteristics will highlight the problems that may arise if nothing is done to combat the poor levels of coverage that exist within a number of economies across Asia.

Table 1.6. Membership of mandatory pension schemes by population and labour force

Country	Year	Members	Percentage of population aged 15 to 65	Percentage of labour force	Country	Year	Members	Percentage of population aged 15 to 65	Percentage of labour force

2 Retirement-income indicators

Pension entitlements are calculated using the OECD pension models. The theoretical calculations relate to workers entering the labour market in 2022 aged 22 including the full impact of legislated pension reforms. A note on the methodology used and assumptions made precedes the pension indicators. The indicators begin with the gross pension replacement rate in mandatory pension schemes: the ratio of pensions to individual earnings. Thereafter follows an analysis of the tax treatment of pensions and pensioners. The third indicator shows the net replacement rate, taking account of taxes and contributions. After this follows two indicators of pension wealth: the lifetime discounted value of the flow of retirement benefits. This indicator also accounts for the retirement age, indexation rules, and life expectancy, and is presented in gross and net terms.

Methodology and assumptions

The indicators of pension entitlements that follow here use the OECD cohort-based pension models. The methodology and assumptions are common to the analysis of all economies, allowing the design of pension systems to be compared directly. This enables the comparison of future entitlements under today's parameters and rules.

The pension entitlements that are presented are those that are currently legislated in the Asian economies. Reforms that have been legislated before publication are included where sufficient information is available. Changes that have already been legislated and are being phased-in gradually are modelled from the year that they are implemented. The values of all pension system parameters reflect the situation in the year 2022 and beyond. The calculations show the pension benefits of a worker who enters the system that year at age 22 and retires after a full career. The main results are shown for a single person. All indexation and valorisation rules follow what is legislated in the baseline scenario.

Career length

The standard OECD definition is used for both the OECD and non-OECD economies. Therefore, a full career is defined here as entering the labour market at age 22 and working until standard pension eligibility age, which, of course, varies between economies. The implication is that the length of career varies with the statutory retirement age: 33 years for retirement at 55, 38 years for retirement at 60, etc.

Coverage

The pension models presented here include all mandatory pension schemes for private-sector workers, regardless of whether they are public (i.e. they involve payments from government or from social security institutions, as defined in the System of National Accounts) or private. For each economy, the main national scheme for private sector employees is modelled.

Pension entitlements are compared for workers with earnings between 0.5 times and twice the average. This range permits an analysis of future retirement benefits of both the poorest and richest workers.

Economic variables

The comparisons are based on a single set of economic assumptions for all the economies covered. Although the levels of economic growth, wage growth and inflation vary across economies, using a single set of assumptions enables comparison without economic affects. Differences in pension levels therefore reflect differences in actual pension systems and government policies. The baseline assumptions are set out below.

Price inflation is assumed to be 2% per year. Real earnings are assumed to grow by 1.25% per year on average (given the assumption for price inflation, this implies nominal wage growth of 3.275%). Individual earnings are assumed to grow in line with the economy-wide average. This means that the individual is assumed to remain at the same point in the earnings distribution, earning the same percentage of average earnings in every year of the working life. The real rate of return on funded, defined-contribution pensions is assumed to be 2.5% per year. Administrative charges, fee structures and the cost of buying an annuity

are assumed to result in a defined contribution conversion factor of 90% applied to the accumulated defined contribution wealth when calculating the annuity. The real discount rate (for actuarial calculations) is assumed to be 1.5% per year.

The baseline modelling uses economy-specific projections of mortality rates from the United Nations population database for every year from 2022 to 2100.

The calculations assume that benefits from defined contribution plans are paid in the form of a price-indexed life annuity at an actuarially fair price assuming perfect foresight. This is calculated from the mortality projections once the conversion factor is taken into account. If people withdraw the money in alternative ways, the capital sum at the time of retirement is the same: it is only the way that the benefits are spread that is changed. Similarly, the notional annuity rate in notional accounts schemes is (in most cases) calculated from mortality data using the indexation rules and discounting assumptions employed by the respective economy.

Taxes and social security contributions

The modelling assumes that tax systems and social security contributions remain unchanged in the future. This implicitly means that “value” parameters, such as tax allowances or contribution ceilings, are adjusted annually in line with average earnings, while “rate” parameters, such as the personal income tax schedule and social security contribution rates, remain unchanged.

Gross pension replacement rates

Key results

The future gross replacement rate represents the level of pension benefits in retirement from mandatory public and private pension schemes relative to earnings when working. For average earners with a full career from age 22, the future gross replacement rate at the normal retirement age averages 49.4% for men and 45.3% for women in the Asian economies, with substantial variation. At the bottom of the range, future gross replacement rates from mandatory schemes are below 40% at the average wage in India, Malaysia and Sri Lanka. The Philippines is highest with a replacement rate of 72%.

Replacement rates are calculated for full-career workers from the age of 22, meaning that career lengths differ between countries. Hong Kong (China), Indonesia and Singapore have a long-term retirement age of 65 years for those starting in 2022, while in Malaysia, Sri Lanka and Thailand it will be 55 for men, and only 50 for women in Sri Lanka (Table 2.1).

Full career male workers will have a replacement rate of 49.4% on average across Asian economies, with a high of 72% in the Philippines and a low of under 40% in India, Malaysia and Sri Lanka. The average for women is slightly lower, at 45.3%. For OECD countries, the average is 50.7% for men and 50.1% for women, at average earnings. All six OECD Asia/Pacific countries have replacement rates below 40%, while they are all above 40% for the other OECD countries, with a high of 76.1% in Italy.

Most OECD countries aim to protect low-income workers (workers earning 50% average earnings) from old-age poverty, which results in higher replacement rates for them than for average earners. Low-income workers would receive gross replacement rates averaging 63.8%. Some countries, such as Australia, pay relatively small benefits to average earners, but are closer to the average for low-income workers.

Four of the Asian economies have the same replacement rate for low and average earners. Except for Pakistan, where the replacement rate is double, low earners in the other Asian economies have a replacement rate for low earners only slightly above that for the average earner.

At the top of the range, based on current legislation, low earners in China will receive a future gross replacement rate of 87.3% after a full career; retirement benefits are thus not much below their earnings when working. At the other end of the scale, Sri Lanka offers a gross replacement rate of 31.9% to low-income earners, thus implying a gross retirement income around 16% of average earnings after a full career. On average, the gross replacement rate at twice average earnings (here called “high earnings”) is 39.7%. Replacement rates for these high earners equal 73% in the Philippines and 59% in China and Viet Nam, while at the other end of the spectrum, India, Pakistan and Thailand are at 21%.

Gross pension replacement rates differ for women in nine economies, due to a lower future pension eligibility age than for men (China, Pakistan, Sri Lanka and Viet Nam) and the use of sex specific mortality rates to compute annuities (Hong Kong (China), India, Indonesia, Malaysia and Singapore). The replacement rates are expressed as a percentage of earnings which are not gender specific. Differences between the sexes are substantial in China, Pakistan and Sri Lanka, with replacement rates (i.e. monthly benefits) for women being between 13% and 34% lower than for men.

Definition and measurement

The old-age pension replacement rate measures how effectively a pension system provides a retirement income to replace earnings, the main source of income before retirement. The gross replacement rate is defined as gross pension entitlement divided by gross pre-retirement earnings. Under the baseline assumptions, workers earn the same percentage of average worker earnings throughout their career. Therefore, final earnings are equal to lifetime average earnings revalued in line with economy-wide earnings growth. Replacement rates expressed as a percentage of final earnings are thus identical to those expressed as a percentage of lifetime earnings.

Tax treatment of pensions and pensioners

Key results

The personal tax system plays an important role in old-age support. Pensioners do not pay social security contributions in any of the Asian economies. Personal income taxes are progressive and pension entitlements are usually lower than earnings before retirement, so the average tax rate on pension income is typically less than the tax rate on labour income. In addition, most of the Asian economies give additional tax concessions to pensioners through either increased personal allowances or extra tax credits or pension income is completely exempt from taxation.

Most Asian economies provide either higher personal allowances or extra tax credits to older people. This relief is irrespective of the source of income and so will include earned income at older ages. Beyond this over half of the economies do not tax pension income.

In addition, some OECD countries have specific tax rules for income from pensions, from either public or private schemes. For example, between 15% and 50% of income from public pensions in the United States (social security) is not taxed, depending on the total income of the pensioner. In Australia, benefits derived from pension contributions and investment returns, which have both been taxed, are not taxable in payment for over 60s. This applies to the mandatory defined contribution scheme and voluntary contributions to such plans.

Virtually all OECD countries levy employee social security contributions on workers: Australia and New Zealand are the only exceptions.

Empirical results

Figure 2.3 shows the percentage of income paid in taxes and contribution by workers and pensioners. Starting with workers, countries have been ranked by the proportion of income paid in total taxes (including social contributions paid by employees) at the average-wage level. This is then compared to the total tax rate paid by a pensioner after a full career at the average wage, hence receiving the gross replacement rate in the base case (Table 2.2, as set out in the indicator “Gross pension replacement rates” above).

In all Asian economies, apart from China, such a pensioner would not pay any tax in retirement. In most cases this is because pensions are not taxable. In others, such as India, for example, it is because the pension income would be less than the income-tax personal allowance offered to older people. Pensioners with the gross replacement rate of a full-career average earner would pay 10% of their income in taxes and contributions on average across the OECD. By comparison, taxes and contributions paid by an average earner – so not including any contributions from the employer – average 27% of the gross wage in OECD countries and 10% in the Asian economies.

The last series in the chart shows how much a pensioner would pay if her income before tax is equal to the gross average wage. The total tax rate is 16% on average in OECD countries, some 11 percentage points lower than what workers’ pay with the same level of income. For the Asian economies the average is under 1%, but only China at 3% and Hong Kong (China) at 4% actually have any payments.

The difference between this 16% rate for pensioners with an income equal to average earnings and the 10% paid in taxes and contributions paid on the income which is equal to the gross replacement rate for an average earner illustrates the impact of progressivity in income-tax systems for pensioners.

Net pension replacement rates

Key results

While the gross replacement rate gives a clear indication of the design of the pension system, the net replacement matters more to individuals, as it reflects their disposable income in retirement in comparison to when working. For average earners with a full career, the net replacement rate from mandatory pension schemes at the normal retirement age averages 54.6% across the Asian economies, which is 5.2 percentage points higher than the average gross replacement rate. This reflects the higher effective tax and social contribution rates that people pay on their earnings than on their pensions in retirement, mostly due to the progressivity of tax systems, some tax advantages to pensions and lower social contributions on pension benefits. Net replacement rates vary across a large range, from 41% in Pakistan to 88% in China for average-wage workers. For low earners (with half of average worker earnings), the average net replacement rate across the economies is 63.0% while it is 45.1% for high earners (200% of average worker earnings).

The previous indicator of the “Tax treatment of pensions and pensioners” showed the important role that the personal tax and social security contribution systems play in old-age income support. Pensioners often only pay health contributions and receive preferential treatment under the income tax. Tax expenditures and the progressivity of income taxes coupled with gross replacement rates of less than 100% also mean that pensioners have a lower income tax rate than workers. As a result, net replacement rates are generally higher than gross replacement rates.

For average earners, the net replacement rate across the Asian economies averages 55% for mandatory schemes, from a low of 41% in Pakistan to 88% in China (Table 2.3). Moreover, the pattern of replacement rates across countries is different on a net rather than a gross basis.

On average, for average earners, the net replacement rate is 5 percentage points higher than the gross replacement rate. The difference is 20 percentage points in China and around 5-7 percentage points in India, Malaysia, Singapore and Viet Nam. In Hong Kong (China), Malaysia, the Philippines, Singapore, Sri Lanka and Thailand pension income is neither liable for taxes nor social security contributions.

For low earners, the effect of taxes and contributions on net replacement rates is slightly more muted than for workers higher up the earnings scale. This is because low-income workers typically pay less in taxes and contributions relative to average earners. In many cases, their retirement incomes are below the level of the standard reliefs in the personal income tax (allowances, credits, etc.). Thus, they are often unable to benefit fully from any additional concessions granted to pensions or pensioners under their personal income tax.

The difference between gross and net replacement rates for low earners is 6 percentage points on average. China has much higher replacement rates for low earners on a net basis than in gross terms being 25 percentage points higher. The net replacement rate for workers earning 200% of the average is highest in the Philippines. The lowest replacement rates for high earners are found in India, Pakistan and Thailand where workers earning 200% of the average will receive net pensions that amount to at most 25% of their net earnings when working.

Definition and measurement

The net replacement rate is defined as the individual net pension entitlement divided by net pre-retirement earnings, taking account of personal income taxes and social security contributions paid by workers and pensioners. Otherwise, the definition and measurement of the net replacement rates are the same as for the gross replacement rate. Details of the rules that national tax systems apply to pensioners can be found in the online Country Profiles available at <https://www.oecd.org/en/topics/sub-issues/public-pensions.html>.

Gross pension wealth

Key results

Pension wealth relative to individual earnings before retirement measures the total discounted value of the lifetime flow of all retirement incomes in mandatory pension schemes at retirement age. For average earners, pension wealth for men is 9.9 times and for women 10.6 times annual individual earnings on average in Asian economies. Gross pension wealth relative to annual individual earnings is higher for women because of their longer life expectancy. The main determinants of variations across countries are differences in the gross replacement rate, in the length of the retirement period, and in indexation rules.

Replacement rates give an indication of the pension promise relative to individual earnings, but they are not comprehensive measures of cumulated pension payments; they look only at the benefit level relative to individual earnings at the point of retirement, or at a given, later age. For a full picture, life expectancy, normal retirement age and indexation must also be considered. Together, these determine for how long the pension benefit is paid, and how its value evolves over time. Pension wealth – a measure of the stock of future discounted flows of pension benefits – takes account of these factors. It can be thought of as the lump sum needed at the retirement age to buy an annuity giving the same flow of pension payments as that promised by mandatory retirement-income schemes.

In defined benefit systems there is often no or a weak link between the replacement rate and the expected duration of benefit withdrawal. However, in the long run, ensuring financial sustainability imposes a trade-off between the replacement rate and the duration of retirement. When retirement ages and pension benefits are held constant, pension wealth increases with longevity gains. In defined contribution systems there is a more direct link between the size of the benefit and the expected duration of benefit withdrawals. In these systems the pension wealth measure is equal to the accumulated assets and therefore independent of longevity increases as these automatically reduce the monthly benefits.

Gross pension wealth at individual earnings equal to the average wage is highest in China at 15.7 times annual individual earnings for men and 15.4 times for women (Table 2.4). It is also larger than 10 times for men and women in the Philippines, Singapore, Thailand and Viet Nam. The lowest pension wealth for men is in Pakistan at 6.1 and for women in Sri Lanka at 6.1, due to low replacement rates, while Hong Kong (China), India and Malaysia are all around 8-9 times.

This indicator is built based on the gender-specific average mortality rates within countries. It thus assumes away differences in life expectancy across income levels. Given that individuals with low (high) income generally have a lower (higher) life expectancy, this implies that the computed numbers overestimate (underestimate) pension wealth for low (high) earners. With this caveat in mind, higher individual replacement rates for low earners than for average earners mean that the computed pension wealth relative to individual earnings is also higher. For men with earnings equal to half average-earnings, pension wealth is 11.5 times their annual earnings on average, and it is 12.4 times for women. China has the highest pension wealth at low earnings for both men and women at 20.2 and 20.4 times, respectively, with Sri Lanka lowest at 7.4 and 6.1 times.

Impact of life expectancy

In countries where the duration in retirement is shorter, such as Indonesia and Pakistan, pension wealth is smaller. The opposite applies in Hong Kong (China) and Singapore, where life expectancy is high. Similarly, since women's life expectancy is longer, pension wealth for women is higher in all countries that use unisex mortality tables to compute annuities or that have defined benefit systems. In addition, some countries have lower retirement ages for women; further extending the payment time.

Impact of indexation

Pension wealth is affected by indexation rules at a given initial replacement rate level. China has a discretionary indexation to a mix of wages and prices but all other Asian economies index to prices when they have a withdrawal system in place. Those with lump-sum withdrawals are assumed to have a price indexed annuity for comparison purposes.

Definition and measurement

The calculation of pension wealth uses a uniform real discount rate of 1.5%. Since the comparisons refer to prospective pension entitlements, the calculations use country-specific mortality rates by age and sex at the year of retirement. Pension wealth is expressed as a multiple of gross annual individual earnings.

Net pension wealth

Key results

As with gross pension wealth, net pension wealth relative to individual net earnings measures the total discounted value of the lifetime flow of all retirement incomes in mandatory pension schemes at retirement age. For average earners, net pension wealth for men is 11.0 times and for women 11.8 times annual individual net earnings on average in Asian economies. Net pension wealth relative to annual individual earnings is higher for women because of their longer life expectancy. The main determinants of differences across countries are differences in the net replacement rate, in the length of the retirement period measured by remaining life expectancy at the normal retirement age, and in indexation rules.

Replacement look only at the benefit level relative to individual earnings at the point of retirement, or at a given, later age. For a full picture, life expectancy, normal retirement age and indexation must also be considered. Together, these determine for how long the pension is paid, and how its value evolves over time. Net pension wealth – a measure of the stock of future discounted flows of pension benefits after taxes and social contributions – takes account of these factors. It is the total net benefits that will be received on average from the mandatory retirement-income schemes.

In defined benefit systems there is often no or a weak link between the replacement rate and the expected duration of benefit withdrawal. In the long run, ensuring financial sustainability imposes a trade-off between the two. When retirement ages and pension benefits are held constant, pension wealth increases with longevity gains. In defined contribution systems there is a more direct link between the size of the benefit and the expected duration of withdrawals. In these systems the pension wealth measure is equal to the accumulated assets and therefore independent of longevity increases as these automatically reduce the benefits.

Net pension wealth at individual earnings equal to average worker earnings is highest in China at 20.3 times annual individual net earnings for men and 20.1 times for women (Table 2.5). The lowest pension wealth for men is found in Pakistan at 6.1 and for women in Sri Lanka at 6.6.

Higher individual replacement rates and the increased tax allowance for many pensioners mean that net pension wealth relative to individual net earnings tends to be higher for low earners than for average earners as well, at least as the estimations here abstract from differences in life expectancy across income levels. For men with individual earnings equal to half-average earnings, net pension wealth is 12.6 times their net earnings on average, compared with 11.0 times for average wage workers. Similarly, for women it is 13.6 for half-average earners and 11.8 times for average earners.

For higher earners net pension wealth is on average 9.1 for men and 9.6 for women, only slightly lower than that for average earners, with China highest and Pakistan lowest.

Impact of life expectancy

Where the duration in retirement is shorter and where pension benefits are defined benefit, e.g. in Indonesia and Pakistan, the individual pension wealth is smaller. The effect is the opposite in Hong Kong (China) and Singapore, where life expectancies are high. Similarly, since women's life expectancy is longer than men's, pension wealth for women is higher when unisex mortality tables are

used or there are defined benefit systems. In that latter case the same level of pension benefits can be expected to be paid over a longer retirement period. Some countries have lower retirement ages for women; extending the payment period even further.

Definition and measurement

Net pension wealth is the present value of the flow of pension benefits, taking account of the taxes and social security contributions that retirees must pay on their pensions. It is measured and expressed as a multiple of net annual individual earnings in the respective country.

Taxes and contributions paid by pensioners are calculated conditional on the mandatory pension benefit to which individuals are entitled to at different levels of earnings. The calculations take account of all standard tax allowances and tax reliefs as well as concessions granted either to pension income or to people of pension age.

Details of the rules that national tax systems apply to pensioners can be found in Chapter 4 for the Asian economies and in the online “Country Profiles” available at <https://www.oecd.org/en/topics/sub-issues/public-pensions.html> for OECD countries.

3 Demographic and economic context

Population ageing has been one of the main driving forces behind changes in pension policies. Ageing is the result of demographic trends in fertility and life expectancy. The first indicator shows the number of births per woman and its development over the last 60 years. Changes in life expectancy – at birth and at age 65 – are shown as the second indicator. The third investigates the degree of ageing measured as the level of and change in the number of people aged 65 and above relative to the number of people of working age (20-64). The last indicator shows the level of the average wage across the economies.

Fertility

Key results

The total fertility rate is below the estimated replacement level – the number of children per woman needed to keep the total population constant – of about 2.1 in developed countries, in nearly all of the economies. The exceptions are Indonesia and Pakistan, with India, the Philippines, Sri Lanka and Viet Nam just below the replacement level. Fertility rates fell sharply in the second half of the 20th century, with many forecasted to rebound slightly in the next few decades.

Fertility rates currently average 1.71 across the Asian economies, below the level that ensures population replacement, but well above the OECD average of 1.46 (Table 3.1). The trend to fewer children has been going on since the late 1950s but stopped around the turn of century on average. The fall in fertility rates reflected changes in individuals' lifestyle preferences, in family formation, and in the constraints of everyday living, such as those driven by labour market insecurity, difficulties in finding suitable housing and unaffordable childcare.

Another effect might come from changes in women's aspiration regarding partnership and childbearing norms, especially in countries such as Japan and Korea where there is a strong link between marriage and maternity. However, the childbearing patterns of unmarried men and women have also changed. For example, around 60% of births now occur outside of marriage in France with 13 other OECD also above 50%. The average proportion of births outside marriage in OECD countries is now just over 40% of the total.

Since 2004, the fertility rate has fallen by 0.62 on average across the Asian economies with all countries seeing a decrease. The biggest decline in fertility rate was in the Philippines going from 3.53 to 1.90, representing a 46% fall. Across the OECD there was only a decline of 0.20 but the starting point was at a much lower level.

This recent decrease in fertility rates is forecasted to reverse in four economies over the next 20 years, namely China, Hong Kong (China), Singapore and Thailand which will see an average increase of 0.14, though the highest level in 2044 in Thailand will still only be 1.27. For the other countries there will be an average fall of 0.24 and the total fertility level across all 11 economies will fall to 1.61 and is forecasted to fall slightly to 1.58 in 2064. For the OECD the average will decline to 1.51 by 2044, with a low of 0.98 in Korea, with only Australia, France, New Zealand and the United States being above 1.6 among the countries listed.

However, forecast uncertainty is considerable, with the 20th percentile of probabilistic projections for the Asian economies average at only 1.16 and the 80th percentile around the replacement rate at 2.01 for 2064, with the 50th percentile at 1.58 (Figure 3.1). The OECD median is 1.54 with the 20th percentile at 1.17 and the 80th percentile at 1.88, still below the replacement rate.

Low fertility rates have wider social and economic consequences. The old-age to working-age ratio will increase sharply placing additional burdens on the working-age population to finance pay-as-you-go pensions and healthcare for older people. Moreover, the workforce will also age over time and so might be less adaptable to technological change.

Definition and measurement

The total fertility rate is the number of children that would be born to each woman if she were to live to the end of her child-bearing years and if the likelihood of her giving birth to children at each age was the currently prevailing age-specific fertility rate. It is generally computed by summing up the age-specific fertility rates defined over a five-year interval. A total fertility rate of 2.1 children per women – the replacement level – broadly ensures a stable population size, on the assumptions of no migration flows and unchanged mortality rates.

Life expectancy

Key results

The remarkable increase in life expectancy is one of the greatest achievements of the last century. Lives continue to get longer, and this trend is predicted to continue although the pace of improvement in old age has slowed slightly. In 2024, life expectancy at birth averaged 73.0 years for men and 78.8 years for women. Among women, the figure was highest in Hong Kong (China) (88.3 years) and lowest in Pakistan (70.3 years). For men, life expectancy at birth was again highest in Hong Kong (China) (83.0 years) and again lowest in Pakistan (65.5). On average across the Asian economies, remaining life expectancy at age 65 is projected to increase by 3.4 years among women and 3.6 years among men by 2065.

Life expectancy at birth averaged 73.0 years for men and 78.8 years for women among the Asian economies in 2024 (Figure 3.2). For the OECD the average was 78.8 years for men and 83.8 years for women.

Remaining life expectancy at 65 significantly contributes to well-being at older ages. It also influences the finances of retirement-income systems. Prior to COVID-19 life expectancy at age 65 in 2020 was 80.3 years for men and 83.7 years for women, on average (OECD, 2022^[1]). These are only slightly below the levels that apply in 2024, as men were at 80.9 years and women at 84.0 years for the average across the Asian economies. The highest levels are found in Hong Kong (China) and Singapore for women, at 90.3 years and 88.3 years respectively. For men Hong Kong (China) is again highest at 86.2 years with Singapore at 84.6 years (Figure 3.3). The lowest levels for women are in Pakistan (79.8 years), the Philippines (80.4 years) and Indonesia (80.7 years) with the Philippines (77.6 years), Pakistan (77.9 years) and Indonesia (78.1 years) being lowest for men.

In 2024, on average in the economies, women aged 65 could expect to live an additional 19.0 years, which is forecast to increase to 22.4 years by 2065. Men of the same age could expect to live 15.9 more years in 2024, with a projected increase of 3.6 years by 2065 to reach 19.5 years. On average for the OECD, women aged 65 today could expect to live an additional 21.6 years, which is forecast to increase to 25.3 years by 2065. Men of the same age could expect to live 18.5 more years in 2024, with a projected increase of 4.2 years by 2065 to reach 22.7 years.

There is considerable variation between economies in life expectancy at older ages. Women in Hong Kong (China) are predicted to live another 29.2 years on reaching age 65 in 2065, followed by Singapore (27.3 years). In contrast, remaining life expectancy at 65 in 2065 for women in Pakistan is only forecast to be 16.3 years (Figure 3.4). For men there is less variation between countries than there is for women. Hong Kong (China) and Singapore will have the longest life expectancy at age 65 in 2065 (24.9 and 23.6 years), with China, Malaysia and Thailand all around 21 years. By contrast, Pakistan (13.9 years) and the Philippines (14.8 years) are ranked at the bottom.

The gender gap in life expectancy at age 65 is predicted to be between two and four years in favour of women in nearly all economies in 2065. A larger gender gap of 4.3 years is observed in Hong Kong (China) with smaller gaps of only 1.7 years and 1.9 years in Malaysia and India, respectively. The gender for OECD countries is also forecast to be between almost two and four years in favour of women in 2065. Larger gender gaps of 5.0 and 4.8 years are observed in both Japan and Korea, respectively. The smallest gender gaps are forecasted for New Zealand (1.5 years) the United Kingdom and the United States (both at 1.6 years).

The above numbers refer to period life expectancy, which measures life expectancy (current or projected) based on mortality rates for people of different ages at a given time (2024 or 2065 here) that hence belong to different birth cohorts. By contrast, cohort life expectancy is based on the projected mortality rates that would apply to the same birth cohort at different ages. It thus takes account of continuing improvements (after 2024 or 2065) that would benefit a given birth cohort. On average, these cohort estimates add 0.8 years for women aged 65 in 2065 and 0.7 years for men (Figure 3.4).

Definition and measurement

Life expectancy is defined as the average number of years that people of a particular age could expect to live if they experienced the age- and sex-specific mortality rates prevalent in a given country in a particular year: in this case, 2024 and 2065. Since the determinants of longevity change slowly, life expectancy is best analysed over a long-time horizon.

Demographic old-age to working-age ratio

Key results

There are 18 individuals aged 65 and over for every 100 persons of working age (ages 20 to 64) on average across all the Asian economies countries, while there were only around nine 30 years ago. Population ageing has been accelerating as this average old-age to working-age demographic ratio – computed by keeping age thresholds constant – is projected to reach 44 over the next 30 years.

The evolution of old-age to working-age ratios depends on mortality rates, fertility rates and migration. Both the Asian economies and OECD countries have seen prolonged increases in life expectancy that most analysts project to continue, implying an increasing number of older people and most likely of pensioners too.

Currently, the demographically oldest Asian economy is Hong Kong (China), with an old-age to working-age ratio equal to 36.0 (meaning 36.0 individuals aged 65 and over for 100 persons of working age defined as 20 to 64) (Table 3.2). China, Sri Lanka and Thailand are the only other economies with an old-age to working-age ratio above 20. By 2054, the old-age to working-age ratio is expected to reach more than 50 in China (64.2), Hong Kong (China) (117.1), Singapore (51.0) and Thailand (56.7).

By contrast, all the other economies are currently between 10 and 20, except for Pakistan (8.8) and the Philippines (9.7). In the second half of this century both of these countries are expected to remain considerably younger than the other economies, at 12.5 in Pakistan and 19.9 in the Philippines, with India and Indonesia being next at around 27. By 2084, the old-age ratio will only increase to 22.8 in Pakistan, nearly 20 below any other economy.

For the OECD there are 33 individuals aged 65 and over for every 100 persons of working age (ages 20 to 64) on average while there were only about 21 30 years ago. Population ageing has been accelerating as this average old-age to working-age demographic ratio – computed by keeping age thresholds constant – is projected to reach 55 over the next 30 years.

Four Anglo-Saxon OECD countries – Australia, Canada, New Zealand and the United States – have relatively low old-age ratios, around 30. This is partly due to inward migration of workers and – except for Canada – to comparatively high fertility rates just below replacement level in recent decades.

For the OECD, the increase in the old-age to working-age ratio is projected to continue according to the medium forecast of United Nations Populations Prospects, from 32.6 in 2024 to 55.2 in 2054 and 67.7 in 2084. By far, Korea is facing the most rapid population ageing among OECD countries. The old-age ratio would increase from (7.3 in 1964) 29.3 in 2024 to 122.0 in 2084 and Korea would move from being the tenth youngest country in the OECD in 2024 to the oldest in 2084, actually reaching this status by 2049.

The projected working-age population (20-64) will remain virtually the same on average across the Asian economies, increasing by only 0.4% by 2064. However, it will fall by at least 29% in China (40%), Hong Kong (China) (63%), Singapore (29%) and Thailand (32%) (Figure 3.5). This will have a significant impact on the financing of pay-as-you-go (PAYGO) systems as it is closely related to their internal rates of return. Even funded pension systems might be negatively affected by rapidly declining working-age populations through its effect on labour supply, in turn potentially lowering output growth and equilibrium interest rates.

By contrast it is projected to increase by 11% in Indonesia, 14% in India, 18% in Malaysia, 24% in the Philippines and by 104% in Pakistan.

For the OECD the projected working-age population will decrease by 12% on average by 2064, i.e. by 0.31% per year. It will fall by 35% or more in Italy and Korea, and by more than 30% in Japan. It is projected to increase by more than 20% in Australia and by 9% in Canada.

Definition and measurement

The old-age to working-age demographic ratio is defined as the number of individuals aged 65 and over per 100 people of working age defined as those at ages 20 to 64.

Table 3.2. Demographic old-age to working-age ratio: Historical and projected values, 1954-2084

	1954	1964	1994	2024	2054	2084		1954	1964	1994	2024	2054	2084

Average wage

Key results

“Average wage (AW)” is an important metric as all pension modelling results are presented as multiples of this measure. The average for all Asian economies was USD 11 944 in 2022 and USD 23 023 in PPP terms.

Table 3.3 reports the Asian economies average wage for 2022, based primarily on survey data. The OECD’s full-time average wage (AW) levels are also given. The wage earnings are defined as gross wages before deductions of any kind (including personal income taxes and social security contributions), but including overtime pay and other cash supplements paid to employees.

Average wages are displayed in national currencies and in US dollars (both at market exchange rates and at purchasing power parities, PPP). The PPP exchange rate adjusts for the fact that the purchasing power of a dollar varies between countries: it allows for differences in the price of a basket of goods and services between countries.

Wage earnings across the Asian economies averaged USD 11 944 in 2022 at market exchange rates. Singapore has the highest at USD 58 701, with Hong Kong (China) next at USD 26 725 and China at USD 16 502 (Table 3.3). The lowest levels are found in Pakistan, at USD 1 274 with India, Indonesia and Sri Lanka also under USD 3 000.

At PPP wages averaged USD 23 023. Singapore is again highest amongst the Asian economies, at USD 93 643, with Hong Kong (China) next at USD 34 442. Pakistan is again the lowest at USD 6 878 followed by Indonesia at USD 6 905. Besides China and Malaysia all the other Asian economies are under USD 20 000. The higher figure for PPP wages suggests that many economies exchange rates with the US dollar were lower than the rate that would equalise the cost of a standard basket of goods and services.

Average wages for the OECD countries are much higher, averaging USD 41 261 at market exchange rates. Australia has the highest wages at market exchange rates for those OECD countries listed at USD 65 678, with Canada and the United States also above USD 60 000. The lowest values among the OECD countries listed are in Italy at USD 35 651 and Korea at USD 38 542.

At PPP wages averaged USD 52 884 across the OECD. Germany is now highest of the countries listed at USD 75 573, with Australia, Canada, the United Kingdom and the United States all around USD 65 000. New Zealand is lowest at USD 48 204 with Italy and Japan being the only other OECD countries, of those listed, below USD 55 000. Again, the higher figure for PPP wages suggests that many OECD countries’ exchange rates with the US dollar were lower than the rate that would equalise the cost of a standard basket of goods and services.

Definition and measurement

The “average worker” earnings series (AW), defined as the average full-time adult gross wage earnings, was adopted from the second edition of *Pensions at a Glance* (OECD, 2007^[2]). This concept is broader than the previous benchmark of the “average manual production worker” (APW) because it covers more economic sectors and includes both manual and non-manual workers. The new AW measure was introduced in the OECD report *Taxing Wages* and also serves as benchmark for *Benefits and Wages*. The third edition of

Pensions at a Glance (OECD, 2009^[3]) also included a comparison of replacement rates under the old and new measures of earnings for eight countries where the results were significantly different.

Table 3.3. Average wage (AW), 2022

	OECD measures of average wages			Exchange rate, national currency per USD	
	National currency	USD, market exchange rate	USD, PPP	Market rate	PPP

Pensions at a Glance Asia/Pacific: Pension profiles

This chapter provides detailed background information on each of the 11 non-OECD economies' retirement-income arrangements. These include pension eligibility ages and other qualifying conditions; the rules for calculating benefit entitlements; the treatment of early and late retirees. The pension profiles summarise the national results in standard charts and tables. The chapters for the OECD countries included can be found at <https://www.oecd.org/en/topics/sub-issues/public-pensions.html>.

China

China: Pension system in 2022

China has a three-tier pension system, consisting of a basic / defined benefit pension, a mandatory second-tier plan and a voluntary third-tier scheme. It covers urban workers with a separate scheme for rural workers.

Key Indicators: China

	China		OECD
Average worker earnings (AW)	CNY	114 029	285 113
	USD	16 502	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	78.1	81.3
	at age 65	82.7	85.0
Population over age 65	% of working- age population	23.1	32.6

Qualifying conditions

Normal pension age is 60 years for men, 50 years for blue collar women and 55 years for white collar women.

Benefit calculation

Basic / Defined benefit.

The pension pays 1% of the average of the indexed individual wage and the province-wide average earnings for each year of coverage, subject to a minimum of 15 years of contributions. The pension in payment is indexed to a mix of wages and prices, which has been about 5% in recent years. The modelling assumes 50% indexation to wages.

Defined contribution (funded or notional accounts)

Employees pay 8% of wages to the individual account system. The accumulated balance in the fund or the notional account is converted into a stream of pension payments at the time of retirement by dividing the balance by a government-determined annuity factor, depending on individual retirement age and average national life expectancy. In all provinces, these annuity factors, for both males and females, (for monthly benefits) are:

Age	40	45	50	55	60	65	70
Factor	233	216	195	170	139	101	56

The modelling results are based on a funded defined contribution system.

Voluntary funded defined contribution

From November 2022 a voluntary private pension plan was launched in 36 Chinese cities to boost voluntary retirement savings. All individuals covered by the state pension programmes for urban or rural workers can choose to participate. Participants can contribute up to CNY 12 000 per year with tax breaks up to this level. This component is not included in the modelling results.

Variant careers

Early retirement

It is possible to claim a pension benefit from the age of 55 years for men and 45 years for women if the individual engaged in physical work in certain industries or posts.

Late retirement

It is possible to defer pension payments until after normal pension age, but the pension benefit is not valorised.

Childcare

There are no credits for periods out of the labour market.

Unemployment

There are no credits for periods out of the labour market.

Self-employed

Self-employed workers are voluntarily covered by the same system as for employees, but their contribution rate is lower at 20%, with 12% going to the pool and 8% to individual accounts.

Personal income tax and social security contributions

Taxation of workers

There is a standard income-tax allowance of CNY 60 000. Employees are allowed to deduct social insurance and housing fund contributions to calculate taxable income.

Taxation of worker's income

Individual Income Tax Rates (applicable to income from wages and salaries).

Annual taxable income	Tax-rate
Less than CNY 36000	3%
The portion of income in excess of CNY 36 000 to CNY 144000	10%
The portion of income in excess of CNY 144 000 to CNY 300000	20%
The portion of income in excess of CNY 300 000 to CNY 420 000	25%
The portion of income in excess of CNY 420 000 to CNY 660 000	30%
The portion of income in excess of CNY 660 000 to CNY 960 000	35%
The portion of income in excess of CNY 960 000	45%

Social security contributions payable by workers

Under the revised system, employers contribute a maximum of 16% of earnings to cover the basic pension. The second-tier pension is financed by an 8% contribution from employees. These contributions are capped at three times the local average wage. The social security contributions to individual accounts are exempt from income taxes.

Taxation of pensioners

There is no additional tax relief for pensioners.

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: China in 2060 retirement at age 60 (men)

Men	Individual earnings, multiple of average					
Women (where different)	0.5	0.75	1	1.5	2	3
Gross relative pension level	43.6	56.0	68.3	92.9	117.6	166.8
(% average gross earnings)	35.2	44.5	53.8	72.5	91.1	128.4
Net relative pension level	56.9	72.8	88.3	118.7	147.6	205.4
(% net average earnings)	45.8	57.9	70.1	93.6	116.6	160.3
Gross replacement rate	87.3	74.6	68.3	61.9	58.8	55.6
(% individual gross earnings)	70.3	59.3	53.8	48.3	45.6	42.8
Net replacement rate	112.6	96.4	88.3	81.3	77.1	70.0
(% individual net earnings)	90.7	76.7	70.1	64.1	60.9	54.7
Gross pension wealth	20.2	17.2	15.7	14.2	13.4	12.7
(multiple of individual gross earnings)	20.4	17.1	15.5	13.8	13.0	12.2
Net pension wealth	26.1	22.2	20.3	18.6	17.6	16.0
(multiple of individual net earnings)	26.3	22.1	20.1	18.3	17.4	15.5

Note: Real rate of return 2.5%, real earnings growth 1.25%, inflation 2%, and real discount rate 1.5%. All systems are modelled and indexed according to what is legislated. Transitional rules apply where relevant. DC conversion rate equal 90%. Labour market entry occurs at age 22 in 2022. Tax system latest available: 2022.

Source: OECD pension model.

StatLink  <https://stat.link/ou4q0z>

Hong Kong (China)

Hong Kong (China): Pension system in 2022

The Mandatory Provident Fund (MPF) system is an employment-based retirement protection system. Except for exempt persons, employees and self-employed persons who are at least 18 but under 65 years of age are required to join an MPF scheme. MPF schemes are, privately managed, fully funded defined contribution schemes.

Key indicators: Hong Kong (China)

	Hong Kong (China)		OECD
Average worker earnings (AW)	HKD	208 719	322 248
	USD	26 725	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	85.6	81.3
	at age 65	88.2	85.0
Population over age 65	% of working- age population	36.0	32.6

Qualifying conditions

Withdrawal of accrued benefits from the MPF System is allowed when scheme members reach the retirement age of 65.

Benefit calculation

Defined contribution

Employees and employers who are covered by the MPF System are each required to make regular mandatory contributions calculated at 5% of the employee's relevant income to an MPF scheme, subject to the minimum and maximum relevant income levels. For a monthly paid employee, the minimum and maximum relevant income levels are HKD 7 100 and HKD 30 000 respectively.

Accrued benefits in the MPF System are withdrawn in a lump sum when scheme members reach the retirement age of 65. For comparison with other economies, for replacement rate purposes the pension is shown as a price-indexed annuity based on sex-specific mortality rates.

Targeted/Basic

The old-age allowance has two levels. Normal old age allowance (NOAA) is means-tested and provided to those aged 65 and over. For a single person, the asset limit is HKD 374 000 and monthly income limit is HKD 10 430 (after which benefits are withdrawn). Limits for married couples are higher (HKD 568 000 and HKD 15 810, respectively). The full benefit is HKD 3 915 per month, which is about 23% of average earnings.

Variant careers

Early retirement

For the MPF System, it is possible to withdraw the benefits from age 60 if ceasing employment permanently. However, the targeted/basic programme does not provide benefits until 65.

Late retirement

It is possible to combine working and receiving pension. For the MPF System, upon reaching age 65, if an individual continues to work, no further mandatory contributions will be required and the individual may withdraw the benefits derived from mandatory contributions.

Personal income tax and social security contributions

Taxation of workers

Employees can claim tax deductions for their mandatory contributions made to an MPF scheme, to a maximum of HKD 18 000.

Taxation of worker's income

The lower of the following two tax rules are applied. The first rule is described in the following tax schedule. This is applied to taxable income (after deduction and allowance). The basic allowance for a single person in 2022 is HKD 132 000:

Annual Taxable Income (HKD)	Tax Rate
Up to 50 000	2%
50 001 to 100 000	6%
100 001 to 150 000	10%
150 001 to 200 000	14%
Over 200 000	17%

Social security contributions payable by workers

The information of mandatory contributions made by employees and self-employed persons to the MPF System are provided in the section of "Defined contribution".

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

MPF benefits derived from mandatory contributions are not subject to tax on withdrawal (only lump sum withdrawal is allowed).

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: Hong Kong (China) in 2065 retirement at age 65

Men	Individual earnings, multiple of average

StatLink  <https://stat.link/6uctip>

India

India: Pension system in 2022

Workers are covered under the earnings-related employee pension scheme and defined contribution employee provident fund administered by the Employees Provident Fund Organization (EPFO) and other employer managed funds. Civil Employees of Central Government who have joined services on or after 1 January 2004 are covered under the Defined Contribution based New Pension System (NPS).

Key indicators: India

	India		OECD
Average worker earnings (AW)	INR	225 593	3 413 520
	USD	2 727	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	72.3	81.3
	at age 65	80.8	85.0
Population over age 65	% of working- age population	12.0	32.6

Qualifying conditions

The normal pension age for earnings-related pension benefits from the Employees' Pension Scheme is 58 years with a minimum of ten years of contributions. The pension age for the earnings-related Employees Provident Fund scheme is 55 years.

Benefit calculation

Employees Provident Fund Schemes (EPF)

The EPF scheme is mandatory for employees with a "Basic Wage" of less than or equal to INR 15 000 per month. Basic Wage does not include many allowances and therefore ranges from 30-50% of total remuneration on average. The modelling assumes 50%. The employee contributes 12% of the Basic Wage and the employer contributes 3.67%. This combined 15.67% accumulates as a lump-sum.

For employees with a Basic Wage greater than INR 15 000 per month, the employee generally contributes 12% of the Basic Wages and the employer also contributes 12%. This combined 24% accumulates as a lump-sum. However, the mandatory obligation on employer contribution of 12% is only with respect to the Basic Wage up to INR 15 000 per month. Therefore, the employer can choose to contribute only up to INR 1 800 i.e. 12% of INR 15 000 instead of the actual Basic Wage, which may be higher.

There is no annuity and full accumulations are paid on retirement after attaining 55 years of age. For comparison with other countries, for replacement rate purposes the pension is shown as a price-indexed annuity based on sex-specific mortality rates.

Employees' Pension Scheme (EPS)

The scheme applies for those with a basic wage under INR 15 000, with the employer contributing 8.33% of the basic wage to the EPS fund and the Central Government contributing a subsidy of 1.16% of the salary. This accumulation is used to pay various pension benefits on retirement or early termination. The kind of pension a member gets under the scheme depends upon the age at which they retire and the number of years of eligible service.

Monthly pension = (pensionable salary x pensionable service)/70

The pensionable salary will be calculated on the average monthly pay (Basic Wage) for the contribution period of the last 60 months (as against 12 months earlier) preceding the date of exit from the membership.

The maximum possible replacement rate is roughly 50%.

With effect from September 2014, there is a minimum pension of INR 1 000 per month.

Variant careers

Early retirement

The EPS can be claimed from age 50 with ten years of contribution and the benefits are reduced by 3% per year of early retirement. If a member leaves his job before rendering at least ten years of service, he is entitled to a withdrawal benefit. The amount he can withdraw is a proportion of his monthly salary at the date of exit from employment. This proportion depends on the number of years of eligible services he has rendered. No pension is payable in cases where there is a break in service before ten years.

When a member has not rendered 10 years of pensionable service on the date of exit or on attaining the age of 58 years, then the member is entitled for a lump sum withdrawal, or the member may opt to receive scheme certificate provided on the date of exit if age is below 58 years. A scheme certificate is issued to members who withdraw their EPF contribution but wish to retain their membership with EPFO, to avail pension benefits on attainment of retirement age. Upon joining a new job, Scheme Certificate ensures that previous pensionable service is added to pensionable service rendered with the new employer thereby increasing the amount of pension benefits.

In case of EPF, there are multiple scenarios, which allow for early access to the accumulation. Partial withdrawals relate to marriage, housing advance, financing life insurance policy, illness of members/family members, withdrawals are also permitted one year before retirement etc. In addition to various permitted partial withdrawals, employees can close their account and withdraw the full corpus in case they move from one employer to another or decide to retire early. No gratuity can be claimed before five years of service.

Late retirement

It is not possible to delay claiming pension after the normal pension age.

Personal income tax and social security contributions

Taxation of workers

Contributions to the provident fund and pension scheme of EPFO and NPS are allowed as deductions from income while computing one's tax liability. A total deduction up to INR 150 000 is applied to social security contributions. This limit also includes other contributions like life insurance premium and Public Provident Fund (Voluntary Scheme) among others.

Workers under NPS also get an additional tax deduction for their employer's contribution into their account subject to a limit of 10% of their salary (Basic Salary + Dearness Allowance). This benefit, provided exclusively to NPS, is over and above the deduction of up to INR 150 000 mentioned. However, this provision is more beneficial to workers in higher income groups as they are likely to be better placed to lock additional savings into their NPS account and would save a higher amount of tax at the maximum marginal rate of 30%.

Health insurance premium up to INR 15 000 is deductible (not included in the model). Transport allowance of INR 800 per month is exempted from taxation (included in the model).

Additional deduction (not included in the model): Medclaim premium paid for parents. Maximum deduction INR 15 000. In case any of the parents covered by the Medclaim policy is a senior citizen, deduction amount is enhanced to INR 20 000.

There is a cap on the maximum amount of contribution made by an employer towards EPF, NPS and superannuation scheme of INR 750 000 beyond which the same is taxed as perquisite in the hands of the employee. Moreover, the amendment provides that any interest attributable towards the excess contribution beyond INR 750 000 was also to be treated as perquisite in the hands of the employee.

Taxation of worker's income

India's financial year begins in April. The following rates apply for 2022:

Annual income from all sources (INR)

Annual income from all sources (INR)	Income tax Rates for Male and Female below 60 years
Up to 250 000	Nil
250 001 – 500 000	5%
500 001 – 750 000	10%
750 001 – 1 000 000	15%
1 000 001 – 1 250 000	20%
1 250 001 – 1 500 000	25%
1 500 001 and above	30%

Additional Surcharge:

- a) 10% of Income tax where total income exceeds INR 5 million
- b) 15% of Income tax where total income exceeds INR 10 million
- c) 25% of Income tax where total income exceeds INR 20 million
- d) 37% of Income tax where total income exceeds INR 50 million

Health & Education cess: 4% of income tax plus surcharge

A resident or Resident but not Ordinarily Resident individual is entitled to rebate under section 87A if his total income does not exceed INR 500 000. The amount of rebate shall be 100% of income-tax or INR 12 500, whichever is less.

Taxation of pensioners

Health insurance premium of up to INR 50 000 is deductible for senior citizens over 60 years.

For super citizens (age 80 years and above), the deduction for the payment of medical premium as well as the actual expenses incurred on their treatment are allowed.

The senior citizens (age 60 years and above) are exempt from income tax on their interest income up to INR 50 000 in a financial year. This applies to interest earned in the savings bank account, deposits in a bank, and/or deposits in post-office.

Senior citizens get a deduction limit of INR 100 000 if they undertake any treatment for specified disease/critical illness in a financial year. This deduction is INR 40 000 for persons below 60 years.

A senior citizen may reverse mortgage any of his accommodation to make monthly earnings. The ownership of the property remains with the senior citizen, and they are given monthly payments for it. The amount paid in instalments to the owner is exempted from Income Tax.

Senior citizens are allowed a standard deduction of INR 50 000 on account of their pension income. This deduction is generally available to all salaried tax employees.

Taxation of pension income

Maturity benefits on account of provident fund and pension from EPFO are fully tax exempt. Lump-sum benefits and Periodic Annuity in case of NPS are taxable when the same is received. EPFO enjoys an EEE regime where it is tax free during contribution, growth and withdrawal phase. NPS, on the other hand is under an EET regime where maturity benefits are taxed. The following income tax rules apply to senior citizens over age 65. An education cess of 4% is charged on the total tax amount.

Annual income from all sources (INR)	Income tax Rates for Senior Citizen	
	Age between 60-64	Age 65+
Up to 300 000	Nil	Nil
300 001 – 500 000	5%	Nil
500 001 – 1 000 000	20%	20%
1 000 001 and above	30%	30%

Additional Surcharge:

- a) 10% of Income tax where total income exceeds INR 5 million
- b) 15% of Income tax where total income exceeds INR 10 million
- c) 25% of Income tax where total income exceeds INR 20 million
- d) 37% of Income tax where total income exceeds INR 50 million

Health & Education cess: 4% of income tax plus surcharge

A resident or Resident but not Ordinarily Resident individual is entitled to rebate under section 87A if his total income does not exceed INR 500 000. The amount of rebate shall be 100% of income-tax or INR 12 500, whichever is less.

Under the NPS, once a subscriber reaches 60 years of age, he or she has to compulsorily purchase an annuity for an amount equal to a minimum of 40% of the accumulated balance in the NPS account. The balance amount can be withdrawn as lump sum at 60 years or can be deferred and withdrawn at any time before reaching age 70. Annuity purchase can also be deferred for a maximum period of 3 years.

One can also withdraw the money before reaching 60 years of age, but in that case one will have to purchase an annuity utilising minimum of 80% of the accumulated corpus at the time of withdrawal.

In case of the untimely death of a NPS member before completion of 60 years of age, the nominee may withdraw the corpus accumulated at the time of death of the account holder. The money received by the nominee or legal heirs is fully exempt.

Social security contributions payable by pensioners

Pensioners do not pay any social security contribution.

Pension modelling results: India in 2058 retirement at age 58 (men)

Men	Individual earnings, multiple of average

StatLink  <https://stat.link/u7h0cy>

Indonesia

Indonesia: Pension system in 2022

Employees are covered by both an earnings-related social insurance scheme and a defined contribution plan.

Key indicators: Indonesia

		Indonesia	OECD
Average worker earnings (AW)	IDR (million	32.28	644.36
	USD	2067	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	71.3	81.3
	at age 65	79.4	85.0
Population over age 65	% of working- age population	12.2	32.6

Qualifying conditions

Normal pension age is 58 years in 2022 gradually rising to 65 by 2043, increasing by one year every three years. Retirement is not required and employees with 15 years of contributions receive a periodical pension benefit while those with less than 15 years get a lump-sum payment.

Benefit calculation

Earnings-related

The pension benefit accrues at 1%. Past earnings are valorised with prices. Contributions are paid up to a monthly ceiling of IDR 9.1 million. The minimum pension after 15 years of contribution is IDR 363 300 per month, with a maximum benefit of IDR 4.36 million per month. Pensions in payment are indexed to prices.

Defined contribution

The Jaminan Hari Tua (JHT) is a compulsory programme for all employees and retirees may opt for a partial lump-sum with a periodical payment until death or only a lump-sum. Employees contribute 2% of earnings and employers pay 3.7% of the payroll. The pension is paid as a lump sum or monthly up to a maximum of five years if the balance is more than IDR 3 million. For comparison with other countries, the pension is shown as a price-indexed annuity based on sex-specific mortality rates.

Variant careers

Early retirement

It is possible to start claiming the pension at any age with a minimum of five years of contribution, if unemployed for at least 6 months.

Late retirement

The benefit may be deferred with no maximum age.

Childcare

There are no credits for periods out of the labour market.

Unemployment

There are no credits for periods out of the labour market.

Self-employed

Self-employed workers are covered by the same system as for employees covering both the employer and employer contributions. The base used for pensions is after the deduction of social security contributions.

Personal income tax and social security contributions

Taxation of workers

There is a deduction of IDR 54 000 000 for a single individual. In addition, work-related expense is tax deductible, and the amount is 5% of earnings up to a ceiling of IDR 6 000 000. There is also a tax-deductible amount of 5% or up to IDR 2 400 000 for pension payments. Social security payments are tax deductible.

Taxation of worker's income

The following table shows the tax rules applied to worker's income:

Annual Income (IDR millions)	Tax Rate
Up to 60	5%
Over 60 up to 250	15%
Over 250 up to 500	25%
Over 500 up to 5 000	30%
Over 5 000	35%

Social security contributions payable by workers

Employees contribute 1% of payroll to the pension plans and 1% to healthcare.

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

The following table shows the tax rules applied to pension income.

Annual Income (IDR millions)	Tax Rate
Up to 50	Nil
Over 50	5%

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: Indonesia in 2065 retirement at age 65 (men)

StatLink  <https://stat.link/4smwfk>

Malaysia

Malaysia: Pension system in 2022

Private sector employees and non-pensionable public sector employees contribute to the provident fund, with social assistance paid to those with insufficient income.

Key indicators: Malaysia

		Malaysia	OECD
Average worker earnings (AW)	MYR	38 544	181 548
	USD	8 760	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	77.0	81.3
	at age 65	82.5	85.0
Population over age 65	% of working- age population	12.4	32.6

Qualifying conditions

The normal pension age is 55, but retirement is not necessary.

Benefit calculation

Defined contribution

Employees pay 11% of monthly earnings to the provident fund according to wage classes, when aged up to age 60, and 0% thereafter. Employers pay 13% of monthly earnings according to wage classes for employees up to 60 years of age and earning under RM 5 000 per month, and 12% for earnings above. Employer contributions are 4% for those aged 60 to 75. There is no ceiling for the contribution.

For those aged under 55 the contribution is made to two different accounts: 70% to Account 1 (retirement) and 30% to Account 2 (education, home purchase, certain critical illnesses and other approved expenses). Once reaching age 55, Accounts 1 and 2 are consolidated into a single account (Akaun 55), and a separate account (Akaun Emas) is created for contributions made after age 55.

It is possible to receive pension in a lump sum, monthly instalments or a combination of both. The minimum total amount to be paid in monthly instalments is RM 250 for at least 12 months, with a minimum withdrawal at any time of at least MYR 2 000, or a combination of these options. For comparison with other countries, the pension is shown as a price-indexed annuity based on sex-specific mortality rates.

The guaranteed minimum interest rate is 2.5% a year. If funds remain in the accounts after age 55, fund members continue to earn compound interest until age 100.

Old-age assistance

A monthly benefit of RM 350 is paid to those aged 60 and assessed as needy (below poverty line), with no financial support from other family members.

Variant careers

Early retirement

It is possible to make a one-time withdrawal of savings at age 50 from Account 2.

Late retirement

It is possible to defer retirement and continue to make contributions after normal pension age.

Personal income tax and social security contributions

Taxation of workers

Mandatory and voluntary provident fund contributions up to RM 6 000 a year are tax deductible.

Taxation of worker's income

Individuals have a personal tax allowance of RM 9 000 per year with additional income taxed as follows:

Chargeable income	Rate
0 – 5 000	0%
5 001 – 20 000	1%
20 001 – 35 000	3%
35 001 – 50 000	8%
50 001 – 70 000	14%
70 001 – 100 000	21%
100 001 – 250 000	24%
250 001 – 400 000	24.5%
400 001 – 600 000	25%
600 001 – 1 000 000	26%
1 000 001 – 2 000 000	28%
2 000 001 and above	30%

Social security contributions payable by workers

In addition to the EPF contribution employees below age 55 pay 0.5% and 0.2% of earnings up to RM 5 000 a month to be covered by social insurance and the Employment Insurance System respectively. The social insurance does not cover old-age pension, but disability, survivor and other pensions and grants.

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

Pension income is tax exempted.

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: Malaysia in 2055 retirement at age 55 (men)

Men	Individual earnings, multiple of average

StatLink  <https://stat.link/w1r9q8>

Pakistan

Pakistan: Pension system in 2022

Workers of an industry or establishment with 5 or more employees are required to be insured under earnings-related pension called employees' old-age benefit scheme.

The model assumes that workers are covered by the earnings-related pension (EOBI).

Key indicators: Pakistan

		Pakistan	OECD
Average worker earnings (AW)	PKR	288 336	9 340 659
	USD	1 274	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	67.9	81.3
	at age 65	78.8	85.0
Population over age 65	% of working- age population	8.8	32.6

Qualifying conditions

Normal pension age for earnings-related private sector pension is age 60 for men and 55 for women with 15 years of contribution (relaxation is provided for those joining the scheme at older ages).

Benefit calculation

Earnings-related

The pension is calculated as average monthly wages multiplied by number of years of insurable employment divided by 50. The indexation rule for pension in payment is discretionary and the model assumes price-indexation.

Minimum pension

Minimum pension is PKR 10 000 per month from July 2023. Indexation for pension in payment is discretionary and the model assumes price-indexation.

Old age grant

A lump sum of one month of the insured's average monthly earnings for each year of contributions is paid for those with at least two but fewer than 15 years of contributions.

Variant careers

Early retirement

The earliest age at which men can start claiming pension is 55 and this is 50 for women.

The reduction applied is 0.5% for each completed month by which age at retirement falls short of 60 (55 years for women). This reduction is also applicable to the minimum pension.

Late retirement

It is possible to start receiving pension after normal pension age.

Personal income tax and social security contributions

Taxation of worker's income

Chargeable income	Rate
0 to 600 000	0%
600 001 to 1 200 000	2.5%
1 200 001 to 2 400 000	12.5%
2 400 001 to 3 600 000	20%
3 600 001 to 6 000 000	25%
6 000 001 to 12 000 000	32.5%
Above 12 000 000	35%

Social security contributions payable by workers

Employer pays 5% of the minimum wage (PKR 13 000) and employee pays contribution at the rate of 1% of minimum wage.

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

All benefits received from the EOBI on retirement or death are not taxed.

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: Pakistan in 2060 retirement at age 60 (men)

Source: OECD pension model.

Philippines

Philippines: Pension system in 2022

Employees up to age 60 earning more than PHP 1 000 a month are covered by the basic, earnings-related and minimum pensions. There are special systems for government employees and military personnel.

Key indicators: Philippines

		Philippines	OECD
Average worker earnings (AW)	PHP	197 853	2 297 411
	USD	3 553	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	70.0	81.3
	at age 65	79.0	85.0
Population over age 65	% of working- age population	9.7	32.6

Qualifying conditions

Normal pension age is 60 with 120 months of contribution.

Benefit calculation

Basic

The monthly basic pension is PHP 1 000.

All pension payments are made 13 times per year in the Philippines. Indexation rule for all pension payment is decided periodically based on price inflation and wage growth and on the financial state of the fund. In the long run, it is assumed that this ad hoc adjustment will be in line with price inflation.

Earnings-related

Earnings-related pension benefit depends on the greater of the following two average earnings: the average earnings over 5 years at 6 months prior to pension claim or the average earnings for the period in which contribution was paid. The benefit is the highest of PHP 300 + 20% of workers' average monthly earnings + 2% of workers' average monthly earnings for each year of service exceeding 10 years + PHP 1 000 or 40% of the workers' average monthly earnings + PHP 1 000, whichever is greater.

Defined-contribution

From January 2021 a new mandatory provident fund known as the Workers' Investment and Savings Program (WISP) was introduced. All workers participating in the SSS social insurance programme with monthly covered earnings of PHP 20 250 or above are automatically enrolled in WISP with a portion of their contribution being allocated to WISP. For 2021, the employer WISP contribution ranges from PHP 42.50 to PHP 425 pesos a month and the employee contribution ranges from PHP 22.50 to PHP 225 a month, depending on an employee's monthly covered earnings.

The SSS plans to invest at least 75% of fund members' assets in low-risk government securities and the remaining portion in blue-chip corporations. Investment returns are tax free, and the principal is protected by the government. The government projects an average annual rate of return of 4.5% for WISP savings.

At retirement, a fund member's total accumulated assets are converted into an annuity that is paid out over at least 15 years. In the event of a fund member's death, the member's total account balance is paid as a lump sum to designated beneficiaries. Early withdrawals from WISP accounts are not permitted.

Minimum

The minimum pension for both basic and earnings-related components is PHP 1 200 a month with a contribution period of between 10 years and 20 years and PHP 2 400 + PHP 1 000 for more than 20 years of contribution.

Variant careers

Early retirement

The pension cannot be claimed before age 60 but is suspended if an old-age pensioner resumes employment or self-employment before age 65.

Late retirement

People can start claiming pension later than normal pension age, but there is no increment for the delayed pension benefits.

Personal income tax and social security contributions

Taxation of workers

Taxation of worker's income

For resident individuals, income tax rates and bands are as follows for 2022:

Chargeable income	Rate
0 to 250 000	0%
250 001 to 400 000	15%
400 001 to 800 000	20%
800 001 to 2 000 000	25%
2 000 001 to 8 000 000	30%
Above 8 000 000	35%

Social security contributions payable by workers

Workers pay 4% of monthly gross insured earnings as social security contribution for pension, sickness and maternity and funeral benefits and the gross insured earnings are set based on 31 income classes. The maximum insured monthly earnings for contribution are PHP 25 000. This will increase to 5% by 2025 with a ceiling of PHP 35 000.

Taxation of pensioners

Under the Expanded Senior Citizens Act of 2003, senior citizens (resident citizens of the Philippines at least 60 years old) are exempted from paying individual income taxes provided their annual taxable income does not exceed the poverty level as determined by the National Economic and Development Authority (NEDA) for that year. They are also entitled to a 20% discount on the price of some services and products,

including medical services and medicines. The 20% discount then becomes a tax credit for the establishment concerned.

Taxation of pension income

All pension incomes are exempt from taxation.

Social security contributions payable by pensioners

Pensioners do not pay any social security contributions.

Pension modelling results: Philippines in 2060 retirement at age 60 (men)

Men	Individual earnings, multiple of average					
<i>Women (where different)</i>	0.5	0.75	1	1.5	2	3

StatLink  <https://stat.link/7qap5m>

Singapore

Singapore: Pension system in 2023

The Central Provident Fund (CPF) covers all Singaporean and permanent resident workers earning a monthly wage of at least SGD 50. CPF is a defined contribution scheme.

Key indicators: Singapore

	Singapore		OECD
Average worker earnings (AW)	SGD	78 660	55 290
	USD	58 701	41 261
Public pension spending	% of GDP		7.7
Life expectancy	At birth	83.9	81.3
	At age 65	86.4	85.0
Population over age 65	% of working- age population	19.8	32.6

Qualifying conditions

The minimum age to start receiving payouts from the national life annuity scheme is 65.

Benefit calculation

Defined contribution

The maximum contribution is calculated based on a salary ceiling of SGD 6 300 per month for both employer and employee contributions. This ceiling level is legislated to increase to SGD 6 800 from 1 January 2024, then SGD 7 400 from 1 January 2025 and finally to SGD 8 000 from 1 January 2026.

The contribution rates vary with age as indicated below. Contributions to the Ordinary Account and Special Account are for retirement, while contributions to the MediSave Account are for medical expenses. Savings in the Ordinary Account can also be used to buy a home, but amounts withdrawn must be refunded with interest upon sale of the property.

Savings in the Ordinary Account earn a minimum interest rate of 2.5% per annum while savings in the other accounts earn a minimum interest rate of 4% per annum. Individuals below 55 years old will be paid an extra 1% interest per annum on the first SGD 60 000 of their combined balances, while individuals aged 55 and above will be paid an extra 2% interest on the first SGD 30 000 of their combined balances, and an extra 1% on the next SGD 30 000. As a result, those aged 55 and above will earn up to 6% interest per annum on their retirement balances.

At age 55, savings in the Ordinary Account and Special Account are set aside in the Retirement Account to meet the Full Retirement Sum (FRS), which is SGD 198 800 in 2023. Savings above the FRS can be withdrawn in a lump sum from age 55. Individuals who own their homes may choose to set aside half the FRS called the “Basic Retirement Sum” (SGD 99 400 in 2023). There is also an “Enhanced Retirement Sum” (SGD 298 200 in 2023) for those who wish to set aside a larger specified sum and receive higher monthly payouts for retirement.

Savings in the Retirement Account are used to purchase a life annuity for the member. The amount of Ordinary Account savings the individual uses to buy a home affects the total amount of savings available to purchase the life annuity and in turn the retirement payouts received. As such, the modelling results below are based on Retirement Account savings from the Ordinary Account, net of housing withdrawals, and Special Account savings.

For the purposes of comparing replacement rates with other countries, this report uses a standardised set of macro assumptions. These results do not take into account other institutional features unique to Singapore. For example, many homeowners in Singapore do not need to pay rent in old age, given the high home ownership rate at 89.7% nationally. In addition, elderly homeowners also have various options to monetise their public housing flat to supplement their retirement income. These options include renting out their spare bedrooms or flats, right-sizing to a smaller flat and taking up the Silver Housing Bonus scheme or selling back part of their remaining lease under the Lease Buyback Scheme (LBS). The LBS is a scheme unique in Singapore's context and is available for all HDB flat types. As such, an alternative modelling scenario where the CPF member monetises his public housing flat in retirement via the LBS has also been provided below. In this scenario, proceeds from the lease sale are used to top up savings in the Retirement Account for a larger annuity stream.

Lower-income members receive additional support. The Workfare Income Supplement Scheme supplements the incomes and CPF savings of lower-income Singaporean workers and encourages them to work regularly. Under the scheme, eligible Singaporeans automatically receive payments of SGD 2 100 to SGD 4 200 per year, based on their age and monthly income.

Older workers receive greater support. In their retirement years, Singaporeans aged 65 and above who had low incomes and CPF contributions during their working years may qualify for the Silver Support Scheme. Under the scheme, eligible elderly Singaporeans automatically receive a quarterly cash supplement of SGD 180 to SGD 900, based on their household monthly income per person and place of residence.

From 2025, the Workfare Income Supplement Scheme and the Silver Support Scheme will be enhanced – the income threshold for scheme eligibility will be raised and eligible Singaporeans will receive higher payout quantum. Additional CPF bonuses will also be introduced to support Singaporeans born in 1973 and earlier to build up their retirement savings.

Employee age (years)	Contribution rate (for monthly wages ≥ SGD 750)			Credited to		
	Contribution by employer (% of wage)	Contribution by employee (% of wage)	Total contribution (% of wage)	Ordinary Account (% of wage)	Special Account (% of wage)	MediSave Account (% of wage)
35 and below	17	20	37	23	6	8
Aged 35-45	17	20	37	21	7	9
Aged 45-50	17	20	37	19	8	10
Aged 50-55	17	20	37	15	11.5	10.5
Aged 55-60	14.5 (15)	15 (16)	29.5 (31)	12	7 (8.5)	10.5
Aged 60-65	11 (11.5)	9.5 (10.5)	20.5 (22)	3.5	6.5 (8)	10.5
Aged 65-70	8.5 (9)	7 (7.5)	15.5 (16.5)	1	4 (5)	10.5
Aged over 70	7.5	5	12.5	1	1	10.5

Note: The figures in brackets apply to the rates that apply from 2024 onwards.

Variant careers

The retirement age in Singapore is age 63, but employers must offer re-employment to eligible employees who turn 62, up to age 68.

Withdrawals

From age 55, individuals can make lump sum withdrawals of their CPF Ordinary Account and Special Account savings in excess of the Full Retirement Sum, and any Retirement Account savings in excess of the Basic Retirement Sum if they own a property. From age 65, individuals can start monthly payouts from their CPF Retirement Account. They also have the option to defer the start of their monthly payouts to age 70 and for higher monthly payouts. Individuals can receive payouts from CPF while continuing to work.

Personal income tax and social security contributions

Taxation of workers

Compulsory CPF contributions are fully tax-exempt. Individuals can also receive tax relief of up to SGD 8 000 per year for voluntary contributions made by their employers or themselves to their own CPF Special or Retirement Accounts, and an additional tax relief of up to SGD 8 000 per year for voluntary contributions that they make to their family members' CPF Special or Retirement Accounts.

Taxation of workers income

There is also tax deductible "earned income relief", and the relief amount depends on the worker's age as described below.

Age	Relief amount
Below 55 years old	SGD 1 000
55 to 59 years old	SGD 6 000
60 years old and above	SGD 8 000

Individuals who wish to save more for their old age can participate in the Supplementary Retirement Scheme (SRS), a scheme operated by the private sector. SRS contributions are voluntary and are eligible for tax relief. Annual SRS contributions for Singaporeans and foreigners are capped at SGD 15 300 and SGD 35 700 respectively. SRS investment returns are accumulated tax-free and only 50% of the withdrawals from SRS are taxable at retirement.

For resident individuals, income tax rates and bands are as follows for income earned from 2024 onwards:

Chargeable income	Rate (%)
Up to SGD 20 000	0
Over SGD 20 000 up to SGD 30 000	2
Over SGD 30 000 up to SGD 40 000	3.5
Over SGD 40 000 up to SGD 80 000	7
Over SGD 80 000 up to SGD 120 000	11.5
Over SGD 120 000 up to SGD 160 000	15
Over SGD 160 000 up to SGD 200 000	18
Over SGD 200 000 up to SGD 240 000	19
Over SGD 240 000 up to SGD 280 000	19.5
Over SGD 280 000 up to SGD 320 000	20
Over SGD 320 000 up to SGD 500 000	22
Over SGD 500 000 up to SGD 1 000 000	23
Over SGD 1 000 000	24

Social security contributions payable by workers

Workers make contributions to the CPF as described above.

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

Retirement income from CPF is exempted from personal income tax.

Pensions from approved pension schemes may be taxed. The amount of pension accrued up to 31 Dec 1992 in the approved funds in Singapore is exempt from tax if the person retired at the retirement age stated in the pension or provident funds/schemes.

Pensions paid out of contributions made to the funds after 31 Dec 1992 will be taxed.

Social security contributions payable by pensioners

Individuals who work while receiving retirement income from CPF continue to make CPF contributions.

Sri Lanka

Sri Lanka: Pension system in 2022

Employees in the formal private sector are covered by defined contribution plans: Employees Provident Fund, which is used in the model, Employees Trust Fund or approved private sector provident fund. Civil servants were formally covered by public sector pension scheme.

Key indicators: Sri Lanka

		Sri Lanka	OECD
Average worker earnings (AW)	LKR	582 552	15 063 556
	USD	1 596	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	77.6	81.3
	at age 65	82.2	85.0
Population over age 65	% of working- age population	20.9	32.6

Qualifying conditions

At age 55 for men and 50 for women.

Benefit calculation

Defined contribution

Employee's provident fund is a fully-funded defined-contribution plan and employees contribute 8% of wage and employers pay 12%. The entire lump sum, including interest, is paid at the time of exit. The annual interest rate must be at least 2.5%. For comparison with other countries, for replacement rate purposes the pension is shown as a price-indexed annuity based on sex-specific mortality rates.

Variant careers

Early retirement

At any age if the government closes the place of employment, if emigrating permanently, or for employed women who marry.

Late retirement

It is not possible to start claiming pension after the normal pension age.

Personal income tax and social security contributions

Taxation of workers

There is no income tax relief and the deduction of work-related expenses.

Taxation of worker's income

There is a personal allowance of LKR 1 200 000 with additional income taxed as follows.

Annual income band	Tax rate
Up to LKR 500 000	6%
Next LKR 500 000	12%
Next LKR 500 000	18%
Next LKR 500 000	24%
Next LKR 500 000	30%
LKR 2 500 001 and above	36%

Social security contributions payable by workers

Employees' contributions are deductible up to a limit of LKR 25 000 per annum.

Taxation of pensioners

All purchased annuities of retirees are exempt.

Taxation of pension income

Annual income band	Tax rate
Up to LKR 10 000 000	0
LKR 10 000 001- LKR 20 000 000	6%
LKR 20 000 001 and above	12%

Social security contributions payable by pensioners

Pensioners do not pay any social security contribution.

Population over age 65	% of working- age population	24.0	32.6

Qualifying conditions

The insured (both men and women) who have reached the age of 55 are qualified to get old age benefit. At least 180 months (15 years) of contributions are required for monthly pension receipt and the pension benefit is adjusted for a longer contribution period. For the insured persons with less than 180 months of contribution a lump sum payment equivalent to the total contributions is made. In both cases employment must cease.

Benefit calculation

Earnings-related

Workers accrue 20% of their earnings for the first 15 years and then 1.5% for every year thereafter. The base wage used for benefit calculation is the average wage over the last five years prior to retirement. Indexation rules are discretionary and the modelling assumes price indexation of pensions in payment.

Old-age allowance

The old-age allowance was previously paid to all Thai citizens aged 60 or older, regardless of their incomes, if they were not entitled to public-sector pensions. The monthly benefit is THB 600 for those aged 60 to 69, THB 700 for those aged 70 to 79, THB 800 for those aged 80 to 89, or THB 1 000 for those aged 90 or older. From 12 August 2023 the benefit now has a means tested element and all new claimants must now also have household income below a limit set by the National Commission for the Elderly.

Variant careers

Early retirement

It is not possible to claim the earnings-related pension before the normal age of 55.

Late retirement

It is possible to retire later than the age of 55 and the pension continues to accrue by 1.5%.

Personal income tax and social security contributions

Taxation of workers

There are various tax relief systems and the employed receive a tax deduction of 50% of assessable income up to THB 100 000. Single insured persons receive a personal allowance of THB 60 000. Social security contributions are tax deductible.

Taxation of worker's income

The following tax schedule is applicable to taxable income (assessable income after deductions and allowances).

Annual taxable income	Tax rate
Up to THB 150 000	0%
THB 150 001 – THB 300 000	5%
THB 300 001 – THB 500 000	10%
THB 500 001 – THB 750 000	15%
THB 750 001 – THB 1 000 000	20%
THB 1 000 001 – THB 2 000 000	25%
THB 2 000 001 – THB 5 000 000	30%
Over THB 5 000 000	35%

Social security contributions payable by workers

Insured persons pay social security contributions. For old age pension, the contribution rate is 3% between the floor of THB 1 650 per month and the ceiling of THB 15 000 per month. They also pay 1.5% of earnings for sickness, maternity, invalidity and death benefits and 0.5% of earnings for the unemployment insurance scheme.

Taxation of pension income

All pension incomes are exempted from taxation. The elderly above 65 who continue working receive an old age tax allowance of THB 190 000.

Social security contributions payable by pensioners

Pensioners do not pay social security contributions.

Pension modelling results: Thailand in 2055 retirement at age 55 (men)

Men	Individual earnings, multiple of average					
<i>Women (where different)</i>	0.5	0.75	1	1.5	2	3
Gross relative pension level (% average gross earnings)	22.6	34.0	41.5	41.5	41.5	41.5
Net relative pension level (% net average earnings)	23.6	35.4	43.2	43.2	43.2	43.2
Gross replacement rate (% individual gross earnings)	45.3	45.3	41.5	27.6	20.7	13.8
Net replacement rate (% individual net earnings)	47.2	47.3	43.2	28.4	21.4	14.5
Gross pension wealth (multiple of individual gross earnings)	11.1	11.1	10.2	6.8	5.1	3.4
Net pension wealth (multiple of individual net earnings)	11.6	11.6	10.6	7.0	5.3	3.6
	13.2	13.3	12.1	8.0	6.0	4.1

Note: Real rate of return 2.5%, real earnings growth 1.25%, inflation 2%, and real discount rate 1.5%. All systems are modelled and indexed according to what is legislated. Transitional rules apply where relevant. DC conversion rate equal 90%. Labour market entry occurs at age 22 in 2022. Tax system latest available: 2022.

Viet Nam

Viet Nam: Pension system in 2022

Viet Nam Social Security (VSS) manages and administers social security contributions and benefits (including pensions) for both private sector workers and government workers. The current pension scheme is a pay-as-you-go defined benefit (PAYG DB) scheme.

Key indicators: Viet Nam

	Viet Nam		OECD
Average worker earnings (AW)	VND (million)	89.61	974.42
	USD	3 795	41 261
Public pension spending	% of GDP		7.7
Life expectancy	at birth	74.7	81.3
	at age 65	82.1	85.0
Population over age 65	% of working- age population	15.0	32.6

Qualifying conditions

The normal pension age was 60 years 6 months for men and 55 years 8 months for women in 2022, with a minimum of 20 years of contributions. From 1 January 2021 the retirement age has been increasing by 3 months per year for men, reaching 62 in 2028 and 4 months per year for women, reaching 60 in 2035.

A lump sum payment is made for people with shorter contribution periods.

Benefit calculation

Earnings-related

45% of the insured's average monthly covered earnings is paid for the first 20 years (men) or 15 years (women) of contributions plus 2% of the insured's average monthly covered earnings for each year of contributions exceeding 20 years (men) or 15 years (women). The maximum accrual is 75%.

Old-age grant

If total contributions are less than 20 years, retirees receive a lump sum is paid of 1.5 times the insured's covered average monthly earnings in the last five years for years of contributions before 2014, plus 2 times the insured's covered average monthly earnings in the last five years for contributions since 2014.

Old-age social assistance

The minimum social pension is VND 360 000. A multiplier is applied to this minimum level: (i) 15 for those aged 60 to 79 who are living in poor households without family members, or with support from family members who are also receiving social assistance benefits; (ii) 2 for those aged 80 and over who are living in poor households without family members, or with support from family members who are also receiving social assistance benefits; and 1 for those aged 80 and over who do not have any social insurance and

assistance benefits; and (iii) 3 for any older people who are living in poor households without family members but receiving support from community.

Variant careers

Early retirement

It is possible to retire and to start claiming the pension at age 55 for men and 50 for women under specific requirements. The pension is reduced by 2% of the insured's covered average monthly earnings for each year the pension is taken before the insured's normal pensionable age due to reduced working capacity.

Late retirement

It is not possible to start claiming a pension after the normal pension age. It is possible, however, to combine working and receiving pension.

Personal income tax and social security contributions

Taxation of workers

There is a personal allowance of VND 9 million per month.

Taxation of worker's income

Tax rates applicable to regular annual income are as follows:

Taxed income per year	Tax rate
Up to VND 60 000 000	5%
From VND 60 000 001 up to VND 120 000 000	10%
From VND 120 000 001 up to VND 216 000 000	15%
From VND 216 000 001 up to VND 384 000 000	20%
From VND 384 000 001 up to VND 624 000 000	25%
From VND 624 000 001 up to VND 960 000 000	30%
From VND 960 000 001	35%

Social security contributions payable by workers

Employees pay 8% of monthly salary/wage for retirement benefits. The minimum and maximum monthly earnings for contribution and benefit calculation purposes are the minimum wage and 20 times of the minimum wage, respectively. From 1 July 2022 onwards they will be VND 3 000 000 and VND 60 000 000, respectively. In addition, employees pay 1.5% health contributions with the same ceiling as for pension contributions and 1.0% for unemployment insurance with a ceiling of 20 times the regional minimum wage – for analysis Region I is being used with a monthly minimum wage of VND 4 680 000.

Taxation of pensioners

There is no additional tax relief for pensioners.

Taxation of pension income

The same taxation rule is applied to pension benefits.

Social security contributions payable by pensioners

Pensioners do not pay any social security contribution.

Pension modelling results: Viet Nam in 2062 retirement at age 62 (men)

Men	Individual earnings, multiple of average					
Women (where different)	0.5	0.75	1	1.5	2	3

Pensions at a Glance Asia/Pacific 2024

Many of Asia's retirement-income systems are ill-prepared for the rapid population ageing that is underway. Asia's pension systems urgently need to be reformed to ensure that they are both financially sustainable and provide adequate retirement incomes. This report examines the retirement-income systems of 11 non-OECD economies in the region, comparing the results with a selection of OECD countries. The report provides new data for comparing pension systems of different economies. It combines the OECD's expertise in modelling pension entitlements with a network of national pension experts who provided detailed information at the country level, verified key results and provided feedback and input to improve the analysis.
